WALK-IN BOX MANUFACTURING REQUIREMENT

What is considered a walk-in cooler or freezer (WICF)?

- Any walk-in structure intended for storing food goods below 0 degrees Celsius (Freezer) or between 0 and 13 degrees Celsius (Cooler)
- The square footage of the WICF unit is under 3,000 sq. ft.
- The WICF unit is not intended for lab, research or environmental usage.

Main impact for our customers:

- Minimum R Value for cooler and freezer panels will be as follows:

Panel	Minimum R value* required	Panel thickness needed to meet the requirement
Cooler temperature panels	25	4 inches
Freezer temperature panels	32	

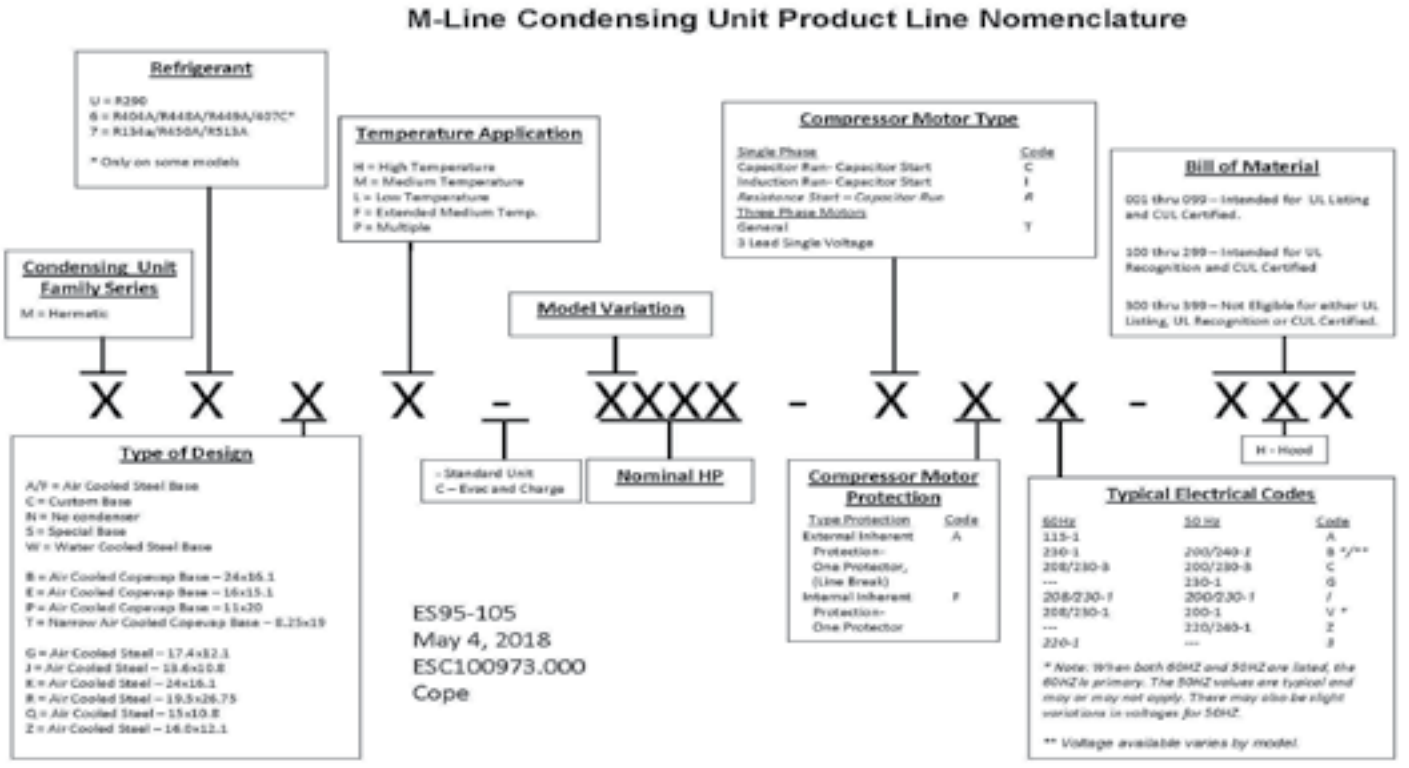

- WICF door energy consumption must not exceed certain values

EMERSON

CO2 Compressors and Scrolls

Emerson CO2 technology leads the trend to efficiency. This refrigerant's non-ozone depleting, non-flammable and near-zero global warming potential properties create an ideal solution towards reducing your environmental footprint.The efficiency, reliability and liquid-handling advantage of Copeland Scrolls, coupled with Emerson Climate Technologies controls, components and transcritical compression architecture makes it ideal for exploiting the positive characteristics of CO2 refrigeration systems.

Temperature range: Above +36OF
Casing: Heavy-gauge textured aluminum
Slabs: 2,3,4,6 or 8
Face tubes: 3, 4 or 6
Fins: 3 FPI
No fans. Air flow through chimney effect

Applications

EGA series are for coolers +36°F and above. The temperature difference should always be between 15°FTD and 20°FTD for proper operation. Extra low air velocity guarantees draft-free conditions with minimum product weight loss.

Specifications

Patented gravity flow EGA series are ceiling mounted. Units use multiple sloped coil slabs for an optimized air distribution.

Coils

Coils are manufactured with seamless deoxidized heavy wall smooth copper tubes and aluminum plate fins. For a maximum heat transfer, the tubes are mechanically expanded into self spaced plate fins with full collar for a permanent bond. Connections and return bends are brazed with high temperature brazing alloy. Coils are factory leak tested at 300 psig and purged with a -40°F dew point dry air. Coils are circuited for HCFC and HFC refrigerant and they are provided with sweat type connections. *(Different coating materials are available)*

Casing

The casing material for standard EGA series is heavy gauge textured aluminum. All units come with stainless steel or plated hardware for a lightweight assembly. *(Other materials are available)*

Drain Pen

EGA series are provided with removable 3/4” female pipe thread drain fitting for easier installation and cleaning when installed with a drain union. All gravity coil are assembled with corrosion free material and components. *Specifications are subject to change without notice.*

CO2 GAS COOLERS & EVAPORATORS

THE NATURAL ALTERNATIVE

RefPlus offers a full line of quality built, custom- made CO_2 gas coolers and evaporators. CO_2 systems are a green and energy efficient alternative to synthetic refrigerant systems. RefPlus CO_2 units are built with the highest standards and heavy-duty components for an extended operating life.

THE ADVANTAGES OF A CO_2 SYSTEM

RefPlus' CO_2 technology delivers very high performance and excellent heat transfer. It requires very low pumping power when CO_2 is used as secondary fluid and offers the possibility of operating with a very low condensing pressure in cold climate.

CO_2 has high-energy content at higher temperatures. The efficiency of the total system is optimal when this heat can be reclaimed for heating sanitary water or similar applications.

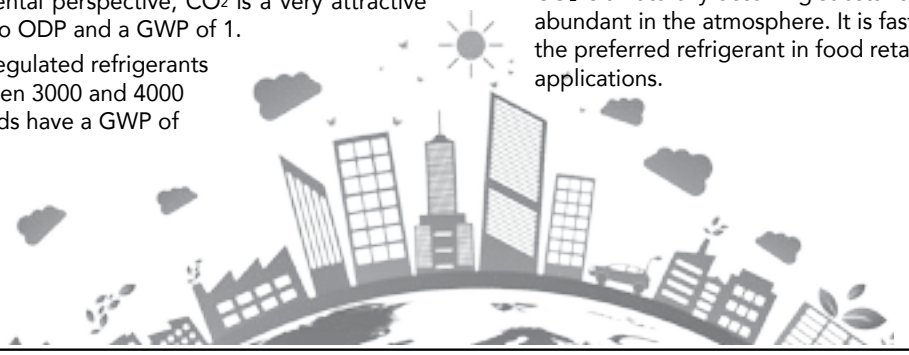

From an environmental perspective, CO_2 is a very attractive refrigerant with zero ODP and a GWP of 1.

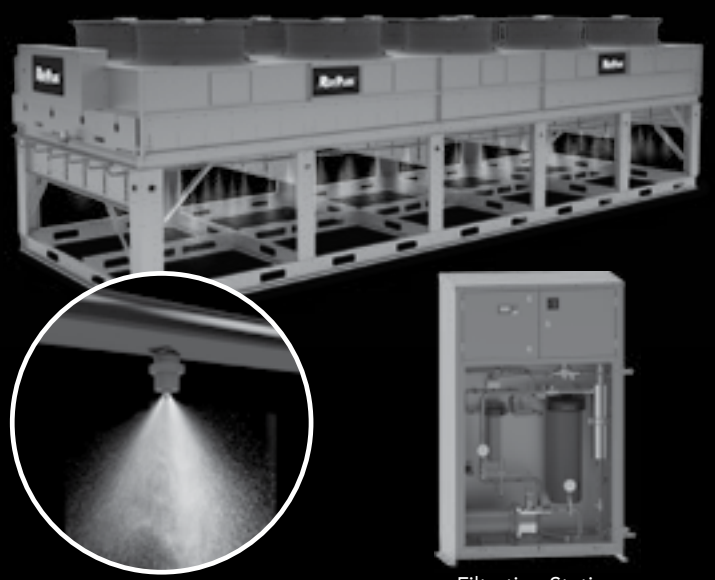

As a comparison, regulated refrigerants have a GWP between 3000 and 4000 and new HFO blends have a GWP of 1500 or less.

- Environmentally-friendly refrigerant GWP=1
- No refrigerant phase out
- Heavy-duty construction - ETL & CRN
- Thick wall copper tubing for better heat transfer
- Adiabatic gas coolers available

THE REFRIGERANT FROM NATURE

CO_2 is a naturally occurring substance and abundant in the atmosphere. It is fast becoming the preferred refrigerant in food retail applications.

MODELS BBM/BBL Back Bar Reach-In Unit Cooler

Application

The BB models are compact, wall-mounted units whose low height makes them ideal for undercounter reach-in or drawer-type fixtures. The unit draws air in at the bottom and discharges out the front. An optional air deflector is included and can be mounted over the center of the fan to direct air up and out. The BBM (medium temperature) model is designed for 35° to 40°F fixture temperature with off-cycle defrost. The BBL (low temperature) model is designed for 0° to -10°F fixture temperature, and has automatic electric defrost.

Features

• Master units include the basic unit plus factory mounted R-404a expansion valve, solenoid, and temperature control. Also right-hand piping extended 8" - 12" outside the housing, sealed and pressurized to 20 - 30 PSI. A 1/4" OD
liquid feed to slave is included

• Slave units include the basic unit plus factory mounted expansion valve with left-hand piping extended 8" - 12" outside the housing, sealed and pressurized to 20 - 30 PSI

Models KM and RAM

Are ideal for use in under-counter reach-in refrigerators. The thin line design allows the unit to be mounted behind the mullion with sufficient clearance for tray slides. KM has an unique fan arrangement allowing air to be drawn in at the top from both sides and discharged at the bottom for superor air circulation. RAM or Reverse Air Mullion draws air thru the coil at the bottom and discharges the cooled air out the top. This provides optimum temperature for drop in trays on salad bars or prep tables. It also keeps drawer stored product in premium condition. These versatile designs also adaptable for mounting on the back wall or ends of a cooler. The method of air circulation ensures minimum box temperature rise when the cabinet doors are open. Ideal for bottle goods and beverage coolers. The finned coil of KM and RAM is protected by BOHN-KOTE finish as standard.

† Estimated sound pressure values are 10 feet from the unit. For estimating sound pressure from the unit at different distances, deduct the following from the unit values: 20 feet, deduct 6 dBA; for 40 feet, deduct 12 dBA; for 80 feet, deduct 18 dBA. This data is typical of "free field" conditions for horizontal air cooled condensing units at the outlet of the discharge air. The actual sound measurements may vary depending on the condensing unit installation. Factors such as reflecting walls, background noise and mounting conditions may have a significant influence on this data.

† Estimated sound pressure values are 10 feet from the unit. For estimating sound pressure from the unit at different distances, deduct the following from the unit values: 20 feet, deduct 6 dBA; for 40 feet, deduct 12 dBA; for 80 feet, deduct 18 dBA. This data is typical of "free field" conditions for horizontal air cooled condensing units at the outlet of the discharge air. The actual sound measurements may vary depending on the condensing unit installation. Factors such as reflecting walls, background noise and mounting conditions may have a significant influence on this data.

† Estimated sound pressure values are 10 feet from the unit. For estimating sound pressure from the unit at different distances, deduct the following from the unit values: 20 feet, deduct 6 dBA; for 40 feet, deduct 12 dBA; for 80 feet, deduct 18 dBA. This data is typical of “free field” conditions for horizontal air cooled condensing units at the outlet of the discharge air. The actual sound measurements may vary depending on the condensing unit installation. Factors such as reflecting walls, background noise and mounting conditions may have a significant influence on this data.

Copper Capillary Tubing

This capillary tubing, used to meter refrigerant flow, is of soft temper. Many manufacturers recommend specific lengths and diameters of capillary tubing for their units, but these specific tube sizes are not always readily available to the serviceman. A capillary tube length conversion chart is available in the references section at the back of this catalog.

InsuClip

The dual-strap fasteener is first fixed to the pipe and then easily slid inside the Clevis Hanger upper space where it is attached to the cross-bolt. Both plastic straps are easily tightened and securely locked into place, just like you would do with a tie-wrap. The InsuClip fastener will not interfere with the swinging movement of the lower U-shaped metal strap as it is only attached to the cross-bolt.

Catch-All Nomenclature

Signficance of the Type Number

The letters and numerals in the Catch-All type number each have a significance. The "C" indicates Catch-All. The **first two or three digits** indicate cubic inches of desiccant. The **last one or two digits** indicate fitting size in eights of an inch. For sealed models, a "-S" following the last digit indicates solder fittings and NO LETTER indicates a flare fitting. Replacable core models (C-420 and larger) only have solder connections and the "-S" is omitted. Examples are: C-083 is 8 cu. in. and 3/8" flare, C-309 is 30 cu. in. and 1-1/8" solder, C-19213-G is 192 cu. in. and 1-5/8" solder.

Other suffix letters indicate special qualities. For example:

- **"-T"** indicates a pressure tap consisting of a Schrader type access valve on the inlet end of the Catch-All
- **"-HH"** indicates a charcoal style core for wax removal and clean-up after a hermetic motor burnout
- **"-F"** indicates a female flare outlet fitting with a male flare inlet fitting
- **"-FM"** indicates a female flare inlet fitting with a male flare outlet fitting
- **"-CAP"** indicate a Catch-All particularly designd for installation on capillary type systems

VALVE TYPE	NOMINAL CAPACITY RANGE (Tons)				CONNEC-TION TYPES	VALVE DESCRIPTION AND APPLICATION
	R-22	R-134a	R-404A & R-507	R-410A		
RC 	1 thru 6	–	–	1 thru 6	Chatleff, SAE Flare, or ODF Solder	Small brass body, externally adjustable valve available for R-22 and R-410A air conditioning and heat pump applications. This valve features a balanced port construction and contains an internal check valve to eliminate the need for an external bypass check valve on heat pump applications. Suitable for replacing OEM type TEVs with or without internal check valve on these applications. Inlet strainer is not included.
ER/SR 	1 thru 12	–	–	1 thru 15	ODF Solder	Small brass body, externally adjustable valve available for R-22 and R-410A air conditioning and heat pump applications. This valve features a balanced port construction and is approved for bi-directional operation. Suitable for replacing OEM type TEVs without internal check valve on these applications. A 60 x 50 mesh inlet strainer is included with 3/8" inlet.
F 	1/5 thru 3	1/8 thru 2	1/8 thru 2	–	SAE Flare	Small brass bar body, externally adjustable valve for small capacity refrigeration systems. SAE flare inlet connection has a removable 100 mesh strainer. Typical applications: Refrigerated cases, coolers, freezers.
EF 	1/5 thru 3	1/8 thru 2	1/8 thru 2	–	ODF Solder	Same as the Type F valve except valve features ODF solder connections. The inlet connection has a 60 x 50 mesh insert type strainer. Typical applications: Refrigerated cases, coolers, freezers.

The valve body, cartridge and thermostatic element is supplied as independent components. This allows body, cartridge and element to be assembled and matched to specific system requirements. Inlet connection has a 100 mesh removable strainer screen. Typical applications: Refrigeration applications and external equalized versions may be used on air conditioning. Type BQ same as above, with balanced port construction.

SPORLAN TEV FIELD CONVERSIONS

Field Conversion of the Thermostatic Expansion Valves with Replaceable Thermostatic Elements

We recognize the fact that occasionally a valve must be converted from one refrigerant to another to satisfy an emergency situation. We feel this practice should be the exception rather than the rule.

The information below provides the necessary data required for field conversion of thermostatic expansion valves from one refrigerant to another by changing power elements. It does not take into account the different springs that are necessary with different refrigerants. But in general, the superheat adjustment on the valve will allow compensation on an operating unit for different spring wire sizes. For further spring information contact SPORLAN.

VALVES WITH NOMINAL CAPACITIES ON THE SAME HORIZONTAL LINE HAVE THE SAME PORT DIAMETER AND PIN ANGLE.

** Recommended Thermostatic Charge for R448A/R449A is the letter 'D'. However, if not available substitute the R22/R407A/F/C letter 'V' element*

APPLICATION FACTORS:

1. The Type ZP charges have essentially the same characteristics as the Type Z charge with one exception: they produce a pressure limit Maximum Operating Pressure (MOP). ZP charges are not intended as replacements for Z charges. Each should be selected for its own unique purpose.
2. All air conditioning and heat pump charges are intended for use with externally equalized valves.
3. Type L liquid charges are also available for most commonly used refrigerants in most element sizes.
4. The Type X charges are not to be used with "EBS" and "O" valves.
5. If in doubt as to which charge to use, review the section on thermostatic charges in Bulletin 10-9 or contact Sporlan Division of Parker, Washington, Missouri with complete system data.
6. For dual temperature applications, use the "C" charge.
7. The "C" charge may be used on applications down to -30°F on R-22, R-404A and R-507.

These factors include corrections for liquid refrigerant density and net refrigerating effect and are based on an evaporator temperature of 0°F. However, they may be used for any evaporator temperature from -40°F to 40°F since the variation in the actual factors across this range is insignificant.

TEV Capacity = TEV Rating x CF Liquid Temperature x CF Pressure Drop — Example: Actual capacity of a nominal 2 ton R-22 Type S valve at 20°F evaporator, 100 psi pressure drop across the TEV, and 90°F liquid temperature entering the TEV = 2.18 (from rating chart) x 1.06 (CF liquid temperature) x 0.89 (CF pressure drop) = 2.06 tons.

① R-422D can be used in a system with R-22 valves, but the TEV capacity will be reduced. Please verify valve capacity will handle system load.

PRODUCT BREAKDOWN

Type RC - For refrigerants 22, 410A, Chatleff, SAE Flare & ODF Solder Connections

Sporlan Type RC valve is a small brass body, externally adjustable valve with balanced portconstruction. The RC valves are available for replacement of types CBI and CBBI valves. These valves contain internal check valves to allow reverse flow on heat pump applications. This eliminates the need for an external check valve piped around the TEV for reverse flow. The RC valve can be used on heat pump and air conditioning (cooling only) applications. This allows you to reduce inventory by using the same valve to replace the I, BI and BBI valves. The RC valvescan even be used to replace the RI valve (non-RPB versions only).
Outlet Connections: 1/2" SAE, 1/2" ODF, 5/8" ODF Mating Distributors (See Bulletin 20-10): D260, D262, 1603, 1605, 1606, 1608, 1620, 1622, 1650(R), 1651(R)

② Valves with SAE inlet and outlet fittings are available only with the 1/4" SAE flare external equalizer; valves with ODF fittings are available only with the 1/4" ODF external equalizer.
③ Valves with Chatleff fittings are available only with the 1/8" OD X 24" long tube with flare and nut external equalizer.
④ ODF Solder on Type RC valves indicates a female connection on the valve of proper diameter to receive copper tubing of corresponding OD size. Thus 1/2" ODF will receive 1/2" OD tubing.

SPORLAN TEV AWEF FACTORS

Annual Walk-In Efficiency Factors for Systems Utilizing Sporlan Thermostatic Expansion Valves

Annual Walk-in Energy Factor (AWEF) is an energy standard by the Department of Energy (DOE) that measures electrical energy input versus its cooling capacity. All commercial refrigeration equipment manufacturers should comply with the AWEF rating specified by the DOE. Walk-in equipment of 3000 ft² or less must conform to this new requirement.

Most unit manufacturers are accomplishing the new standard by lowering the head pressure setting of the unit. This lower head pressure setting greatly impacts expansion valve sizing. This bulletin will help provide thermostatic expansion valve selections for AWEF applications. **This bulletin should not be used for applications outside of AWEF.**

Sporlan researched compressor efficiencies, distributor sizing, and valve sizing at the maximum summer condition and the minimum winter condition for these applications. The values presented in the following tables provide maximum and minimum BTU/hr load at the rated condition of the unit. Most times, this rating will be at 105°F condensing temperature and 96°F liquid temperature. Recommendations in this bulletin are in accordance with AHRI 1250.

This bulletin will help the contractor and wholesaler accurately size and select the proper thermostatic expansion valve for the application. For selection of an electric expansion valve, reference Bulletin 500-100-AWEF.

SELECTION PROCEDURE for AWEF UNITS

1. Select the chart with the system refrigerant
2. Determine saturated suction temperature (SST)
3. Determine thermostatic charge required
4. Select appropriate valve for unit's capacity

Example: Select a Type ER valve for R-407A. The rated unit capacity is published at 4500 BTU/hr and operates at a +25°F saturated suction temperature.

Using the R-407A table, the ERVE-1/2 has a capacity range of 3201 – 5400 BTU/hr at +25°F. The rated capacity of the unit falls between these values. This means the ½ ton valve is correct for the application. The valve will use a KT-43-VC thermostatic charge. This means that the valve required is an ERVE-1/2-C.

The values in the tables below are in BTU/Hr. To determine the appropriate expansion valve, select a valve range that the rated condition of the AWEF unit falls within for the desired evaporator temperature.

Q/BQ Build a Valve Instructions

Type Q & BQ Valves

For Refrigerants 22-134a-404A-410A*-507 – SAE Flare & Extended ODF Solder Connections

*Type Q, EQ, and SQ are not approved for R-410A applications.

The Sporlan Q & BQ series are replaceable cartridge style valves designed for small refrigeration systems, such as refrigerated cases, coolers, and freezers. The externally equalized versions of these valves are ideal for air conditioning and heat pump systems. BQ valves are balanced ported, engineered specifically for systems with a wide range of operating conditions and may be applied on bi-directional applications.

Q & BQ valves are supplied as three individual component parts: the **thermostatic element**, the **valve body**, and the **replaceable cartridge** or orifice. The interchangeable nature of the Q & BQ family make it ideal for reducing inventory, while increasing valve options — so, the right valve is always on hand.

BODY FEATURES

Q & BQ brass body type valves feature Sporlan's traditional knife edge, metal-to-metal thermostatic element to valve body construction, which ensures a leak-proof joint.

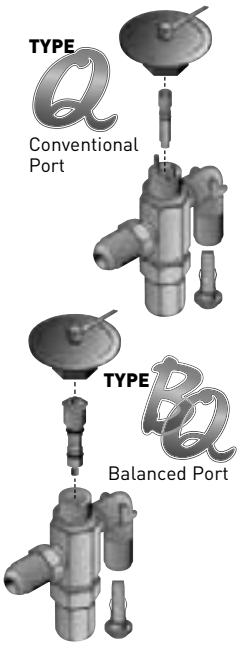

SELECTIVE CHARGES

Sporlan selective thermostatic charges are specifically designed for low temperature, medium temperature, and air conditioning applications. The elements are manufactured with a large flat diaphragm to reduce diaphragm stresses and provide precise control. And, because Q & BQ valve bodies and thermostatic elements are supplied as independent components, the installer is able to select the best possible thermostatic charge for the application.

INTERNAL PORT DESIGN

Refrigerant flow through the valve port opposes the pin movement in all type Q and BQ valves. This provides improved stability at light loads, when the pin modulates to a position close to the port. Additionally, charge migration, is reduced or eliminated by the Q & BQ valve design. By engineering the liquid flow to enter through the top of the valve body, the liquid refrigerant warms the thermostatic element and minimizes the potential for charge migration.

For complete details of construction, see page 35.

The Enclosing Tube Gasket and Manual Lift Stem are potential leak points when changing refrigerants. The enclosing tube design and gasket changed in 1998-1999 to the Wolverine style. The older style (before 6-99) requires replacement of the enclosing tube and gasket. See information below.

NOTE: Wolverine Gaskets may not require changing.

SPORLAN AUXILARY SIDE CONNECTORS

For use with all refrigerants

Auxiliary Side Connectors

ASC-4-3, ASC-5-4, ASC-7-4, ASC-9-5, ASC-11-7, and ASC-13-9

For proper distributor type, order by complete Sporlan type listed below. E.g., an 1126 distributor requires an ASC-11-7 Auxiliary Side Connector. **Do not use an ASC that is smaller or larger than recommended. Bushing up or down at the outlet defeats the purpose of the internal nozzle tube extension. Do not use an ASC on distributors with permanent nozzles.**

Ordering Instructions

Distributors must be ordered with the complete designation: model, number and size of circuits, orifice size, and number and size of the side connection (1650 series only). Example, 1651-2-1/4-2 with one 3/8" OD side connection. The ASC designation is specified as shown above to match with the appropriate distributor. Do not attempt to use an ASC that is smaller or larger than recommended. Bushing up or down at the outlet will defeat the purpose of the internal nozzle tube extension.

Whe sizing distributors the circuit tube length is also required.

Important

When adding an ASC to the solder type distributor, the nozzle must be moved from the distributor to the ASC. When the ASC-H-7 and ASC-M-9 are used the ER or CR nozzle replaces the conventional nozzle.

For additional information see Sporlan Distributor Bulletin 20-10

① Based on 86°F liquid line temperature and a refrigerant flow of 3.1 pounds per minute per ton of Refrigerant 134a; 2.9 pounds per minute per ton of Refrigerant 22; 3.9 pounds per minute per ton for Refrigerant 404A; 2.9 pounds per minute per ton for Refrigerant 407C; 2.8 pounds per minute per ton for Refrigerant 410A and 4.1 pounds per minute per ton for Refrigerant 507. Ratings in accordance to ARI Standard 710.

② 20 drops = 1 gram = 1 cc.

③ The filtration area is equal to the core surface area plus the large internal surface available for depth filtration.

Notes: R-12 water capacity values are approximately 15 percent greater than R-134a. R-502 water capacities are similar to R-404A and R-507.

The variation in flow ratings of filter-driers having the same size core and shell is caused by the difference in connection sizes used.

LIQUID LINE RATINGS AND SELECTION RECOMMENDATIONS

Selection Instructions

Except for the values in bold (R-22/R-407C/R-410A at 40°F; 8 psi pressure drop), the flow capacities are rated at the maximum recommended pressure drop for **permanent** installation.

To ensure the suction line filter-drier has ample contaminant removal ability, selection must be based on flow capacity and the amount of desiccant required for system clean-up. The suction line filter-drier must be large enough to adequately remove acid, moisture and solid contaminants without causing nuisance plug-ups. Sizing is especially important for sealed type suction line filter-driers since they should be sized to clean a small system with one service call.

To reduce the pressure drop through replaceable core shells, substitute cores with filter elements (see page 44) after the system has been cleaned up. The 6171-5 screen should be discarded when cores are replaced with RPE-48-BD elements in RSF shells.

For complete description of the suggested system clean-up procedure, request Bulletin 40-10.

CATCH-ALL FILTER-DRIERS

SPORLAN

Significance of the Type Number

The letters and numerals in the Catch-All® type number each have a significance. The "C" indicates Catch-All. The **FIRST TWO OR THREE DIGITS** indicate cubic inches of desiccant. The **LAST ONE OR TWO DIGITS** indicate fitting size in eighths of an inch. For sealed models, a **"-S"** following the last digit indicates solder fittings, and **NO LETTER** indicates a flare fitting. Replaceable core models (C-420 and larger) only have solder connections and the "-S" is omitted. Examples are: C-083 is 8 cu. in. and 3/8" flare, C-309-S is 30 cu. in. and 1-1/8" solder, C-19213-G is 192 cu. in. and 1-5/8" solder.

Other suffix letters indicate special qualities. For example:

"-T" indicates a pressure tap consisting of a Schrader type access valve on the inlet end of the Catch-All.

"-HH" indicates a charcoal style core for wax removal and clean-up after a hermetic motor burnout.

"-F" indicates a female flare outlet fitting with a male flare inlet fitting.

"-FM" indicates a female flare inlet fitting with a male flare outlet fitting.

"-CAP" indicates a Catch-All particularly designed for installation on capillary tube systems.

Replaceable Cores and Pleated Filter Elements – Order Separately

Cores for replaceable core type filter-driers are molded of exactly the same desiccants that are used in the popular sealed filter-driers.

Cores are individually packed in ***metal cans***, fully activated and hermetically sealed against moisture and dirt.

Filter Elements are dried and packed in individual sealed metal cans. This method of packaging prevents the element from picking up moisture from the atmosphere.

Detailed ***instructions*** are printed on each can. Each can contains a ***"triple gasket"*** consisting of a new end plate gasket, an end plate gasket for certain competitive filter-driers and a core gasket where desired. See the specifications on page 40 for the number of cores required for each type drier.

RCW-42 – High Water Capacity Core – Order as separate item – Fits ONLY shell type C-R424, C-R425 and C-R427. **Designed specially for use with POE oils.** This core should be used on systems that have a ruptured water cooled condenser, or that have been exposed to the atmosphere, or for some reason have a high amount of moisture in the system.

RC-4864 – Activated Core – Order as separate item – Fits types C-480 thru C-19200 Series shells and Replaceable Suction Filter (RSF) shells. This is the standard core suitable for most installations in the liquid or suction line applications.

RCW-48 – High Water Capacity Core – Order as separate item – Fits types C-480 thru C-19200 Series shells and Replaceable Suction Filter (RSF) shells. **Designed specially for use with POE oils.** This core should be used on systems that have a ruptured water cooled condenser, or that have been exposed to the atmosphere, or for some reason have a high amount of moisture in the system.

RC-4864-HH – Activated Charcoal Core – Order as separate item – Fits types C-480 thru C-19200 Series shells and Replaceable Suction Filter (RSF) shells. This core should be used for wax removal on low temperature systems, and for clean-up of systems that have had a hermetic motor burnout.

RPE-48-BD – Filter Element – Order as separate item – Fits types C-480 thru C-19200 Series shells and **Replaceable Suction Filter (RSF) shells.** This element should be used in RSF shells installed in the **suction line** to obtain the lowest possible pressure drop. In cleaning up a system after a hermetic motor burnout, cores should be used first. Then after the system is thoroughly clean, this filter element can be installed in the RSF shell.

RC-10098 – Activated Core – Order as separate item – Fits types C-30000 and C-40000 Series shells. This core has a high water capacity and should be used on all standard liquid and suction line applications.

RCW-100 – High Water Capacity Core – Order as separate item – Fits types C-30000 and C-40000 Series shells. **Designed specially for use with POE oils.** This core should be used on systems that have a ruptured water cooled condenser, or that have been exposed to the atmosphere, or for some reason have a high amount of moisture in the system.

RC-10098-HH – Activated Charcoal Core – Order as separate item – Fits types C-30000 and C-40000 Series shells. This core should be used for wax removal on low temperature systems, and for clean-up of systems that have had a hermetic motor burnout.

RPE-100 – Filter Element – Order as separate item – Fits types C-30000 and C40000 Series shells. This filter element should be used in the suction line to obtain the lowest possible pressure drop after cores were used for system clean-up.

HH Style Catch-All for Wax Removal

Small amounts of wax are often a problem on **low temperature systems.** Even well engineered systems frequently contain minute quantities of wax which are sufficient to clog expansion valve screens or cause sticking of the valve. Sporlan has developed a special blend of desiccants including activated charcoal which removes small amounts of wax in the liquid line before this wax can cause trouble at the expansion valve. These Catch-All Filter-Driers have been very successful in correcting trouble jobs in the field.

Select an HH Style Catch-All Filter-Drier if wax problems occur on low temperature systems. In addition to their wax removal ability, these filter-driers will remove all of the other harmful contaminants that the standard filter-driers remove. Listed in the table are various Catch-All models that incorporate the HH style core.

CATCH-ALL FILTER-DRIERS

SPORLAN

Type C-144-S-TT-HH through C-149-S-TT-HH

PROVEN BENEFITS:

- **Short overall length**, suitable for cramped piping situations — shorter than other similar type filter-driers.
- Suitable for use on **1 through 5 ton air conditioning systems**, with suction line sizes in the range of 1/29 to 1-1/89. Also applicable on the common suction line of heat pump systems.
- **The famous Sporlan HH core** removes all types of contaminants including moisture, acid, dirt, and sludge. A blend of two desiccants, plus activated charcoal, gives maximum performance.
- **Access valves** permit measuring the pressure drop across the filter-drier during clean-up, following a hermetic motor burnout.

APPLICATION

The short overall length of these filter-driers permit easy installation, even on systems with restricted space. While designed for the minimum possible overall length, these filter-driers are suitable for use on most air conditioning systems. The filter-drier has two access valves for measuring the pressure drop across the filter-drier core during the clean-up process.

Heat pump systems frequently have cramped piping in the very compact cabinet. The C-140 Series Catch-All is not a reversible filter-drier, therefore it must be installed in the common suction line. The service technician needs a short suction line filter-drier to fit in this restricted space. The C-140 Series Catch-All meets this essential need.

CONSTRUCTION

The core is held in place by a leaf spring at the inlet end. Filtration occurs on the core surface, and a 100 mesh screen is used as a safety filter at the outlet end. The screen and core are sealed to the shell wall with a fiberglass pad. The threaded valve core for each access valve is supplied in a separate envelope. This way the heat sensitive valve core can be installed after brazing the Catch-All into the line. The Catch-All utilizes copper connections for ease in brazing with any type of alloy.

While designed for use in the suction line these filter-driers may be installed in the liquid line, if desired under unusual circumstances. The performance of these filter-driers in the liquid line is similar to the popular C-160 Series Catch-All Filter-Driers.

**The water capacity and acid capacity of the C-140 Series are comparable to the popular C-160-S-T-HH Series Filter-Drier. Specific values are not listed since the industry has no standard method for testing the water capacity or acid removal ability in the suction line of refrigerant systems. The flow capacity information above permits selecting C-140 Series Catch-Alls for various conditions with confidence.*

SPORLAN - R-410A

RSF-4817-T

The Replaceable Suction Filter shell, used with RPE-48-BD pleated filter element, is designed to be installed in the suction line of new systems to remove circulating contaminants.

Design Benefits

- **High flow capacity**
- **Corrosion resistant coating on shell**
- **Can be used with desiccant cores for clean-up after burnout**
- **Various fitting sizes up to 3-1/8" line size**
- **Access valve supplied for pressure drop measurement or charging**

How It's Used

Sporlan Replaceable Suction Filters are installed in the suction line of refrigeration or air conditioning systems to remove contaminants that may be in the system at startup.

The Replaceable Suction Filter has large fittings permitting the use of a small shell on a system with large line sizes, resulting in considerable economy. The angle construction is suitable of flow in either direction, which results in easy installation even on compact racks.

The Replaceable Suction Filters should be used with cores for cleaning up a system after a hermetic motor burnout. Select the RC-4864, RC-4864-HH or RCW-48 replaceable cores. After cleanup, install RPE-48-BD elements in the shells.

Flush-All SFD-163S Filter-Drier

The patented Flush-All SFD-163S filter-drier offers three levels of filtration, efficiently capturing particles disturbed during purging procedure and system maintenance. The core provides necessary water and acid removal, then a unique 20 micron filter media bonded to the core optimizes the solid contaminant holding capacity, while a low micron fibrous outlet pad completes the filtration process. The three stage filtration achieves best in the industry filtration characteristics.

Also available in Kits, the Flush-All SFD-163S filter-drier coupled with the powerful Flush-All chemical solvent for a unique total solution for system conversions or compressor burnouts.

SPORLAN

Catch-All Filter-Drier Type C-052-CAP-TT-HH

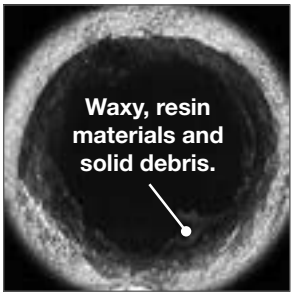

Filter-Drier for Cap Tube Systems

Catch-All® Filter-Drier
Type C-052-CAP-TT-HH

Problem

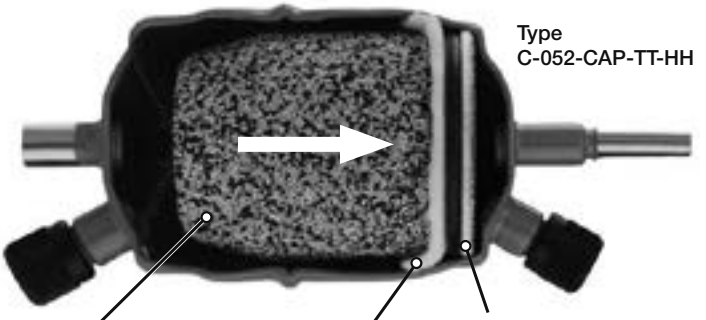

Capillary tubes clog with **waxy, resin** materials and solid debris in small refrigerating systems. This reduces the system capacity and efficiency, requiring capillary tubing replacement.

Cause

Waxy, resin materials deposit in the capillary tubing and attract/hold solid debris that reduces the flow area of the capillary tube.

Superior 3 stage filtration virtually *eliminates* plugged cap tubes.

Stage 1
Porous molded Catch-All HH Core filters the vast majority of particles.

Stage 2
10 micron filter to capture all but the finest particles.

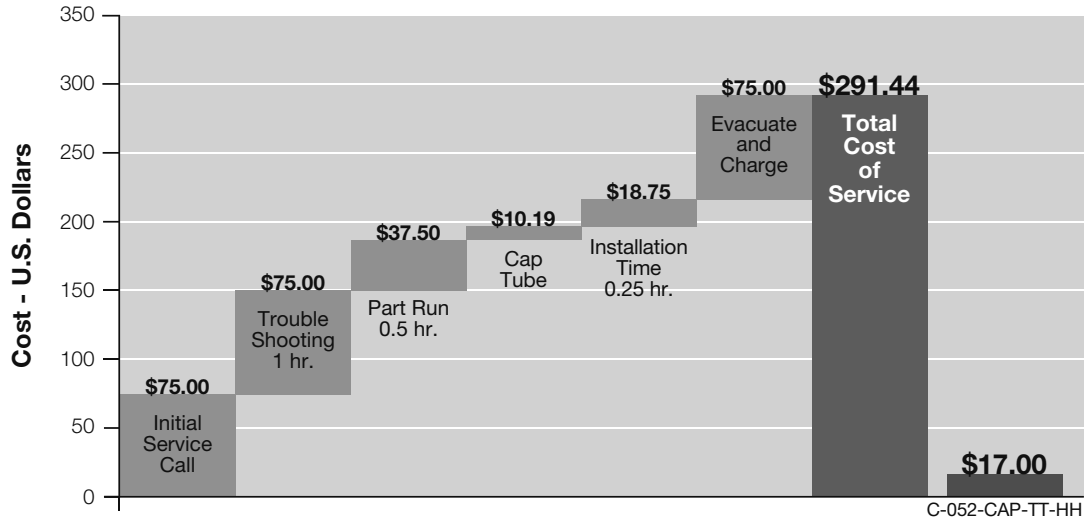

Stage 3
1 micron final filter to capture remaining particles.

Solution

- Porous, molded **Catch-All HH Core** contains the ideal desiccant blend to capture those resins and waxes, eliminating the “sticky” material before it deposits in the capillary tube.
- Uses “3 stage filtration” to capture even the smallest particles of solid debris while maintaining low pressure loss.
- Eliminates nuisance call-backs and increases customer satisfaction.
- Dual pressure taps allow easy pressure drop monitoring during cleanup.

Dual voltage 4-wire coils, 120-208-240/50-60 are available at slight additional cost. For other voltages and cycles, consult Sporlan, Washington, MO 63090.
Coils are available with conduit boss or junction box.
Manual Lift Stem is not available with Normally Open Valves.
For OE43-HP Series Valves: When using 208 volts, do not operate 208-240 volt coil at 85% voltage and hot coil. If so, MOPD may be lower than stated in this bulletin. Use OMKC-1 208/50-60 coil.

The **404A, 407C, 502,** and **507** factors include corrections for liquid refrigerant density and net refrigerating effect and are based on an average evaporator temperature of 40°F. For each 10°F reduction in evaporating temperature, capacities are reduced by approximately 1-1/2%. The **R-717** factors include corrections for liquid refrigerant density and net refrigerating effect and are based on an average evaporator temperature of 5°F. For each 10°F reduction in evaporating temperature, the above capacities are reduced by approximately 3/4%.

3-WAY HEAT RECLAIM VALVES

SPORLAN R-410A

Sporlan Heat Reclaim Valves are tight synthetic seating three way valves designed specifically to divert hot gas from the normal to auxiliary condenser.

Operation "B" Type

Normal (Outdoor) Condenser – De-energized – With the pilot valve de-energized, high side pressure is prevented from entering the cavity above the piston-seat assembly. At the same time the upper pilot port is opened to suction pressure. The resulting pressure differential across the piston moves the piston-seat assembly to close the reclaim (upper) main port. When the upper pilot port is open, the cavity above the piston is open to suction. Pump out of the reclaim condenser is controlled by the bleed rate through the piston. After the reclaim condenser has been pumped out, and the valve continues to operate in the normal condenser mode, **all flow ceases,** thus eliminating high to low side bleed and the resulting capacity loss.

"C" Type

Normal (Outdoor) Condenser – De-energized – With the pilot valve de-energized, high side pressure is prevented from entering cavity above the piston-seat assembly. At the same time the upper pilot port is opened to suction pressure. The resulting pressure differential across the piston moves the piston-seat assembly to close the reclaim (upper) main port. The non bleed piston prevents high to low side bleed with the system operating in the normal condenser mode.

"B" and "C" Type

Reclaim (Reheat) Condenser – Energized – When the pilot valve is energized, high side pressure is permitted to flow through the lower pilot port. At the same time the upper pilot port is closed to suction. High side pressure on top of the piston moves the piston-seat assembly to close the normal condenser port and open the reclaim (upper) main port. With the upper pilot port closed there is no high to low side bleed loss with the system operating in the reclaim mode.

Heat Reclaim Systems

- **with Head Pressure Control**
- **with Split Condenser Control**

When employing heat reclaim on a refrigeration system, the addition of head pressure controls is important not only to maintain liquid pressure at the expansion valve inlet, but also to assure availability of quality hot gas at the reclaim heat exchanger. Split condenser controls are important to minimize the required refrigerant charge for wintertime operation. And, integral check valves are important to minimize installation costs. Selection

1. For a given refrigerant, select a valve having a port size with capacity most closely matching the evaporator maximum load requirements in tons at the design evaporator temperature. Take into account the allowable pressure drop across the valve port.
2. Select the proper coil assembly for the valve type and match the voltage requirements. All AC voltage options are available. For voltages not listed in coil specification, consult Bulletin 30-10, or Sporlan, Washington, MO.

Solenoid Valves for Secondary Coolant Glycol

Description

A new line of solenoid valves to control secondary coolants has been developed for supermarket systems. These fluids include propylene glycol, ethylene glycol, Pecasol 50, Dynalene HC-40, and others. Parker's valve is the only valve designed to meet the requirements of both medium and low temperature applications encountered in supermarket applications.

For Supermarket Refrigeration

What is Secondary Cooling?

In a secondary coolant, or secondary loop system, a chilled solution, such as propylene glycol, is circulated throughout the system rather than liquid refrigerant. Secondary coolant systems are advantageous because they can eliminate liquid refrigerant and suction gas lines running through a store. This reduces installation costs and labor, and eliminates costly refrigerant leaks. Also, PVC tubing can be used, rather than the heavier, more expensive copper tubing normally used in traditional systems. Another benefit is more efficient defrost cycles with less potential product damage.

Minimum Pressure Drop

In order to achieve good heat transfer through a coil surface, minimizing pressure drops throughout the system is critical. Parker secondary coolant valves do not require a minimum pressure to operate.* This is because of the valve's unique "hung diaphragm" design. Other pilot operated valves require some minimum pressure drop to open the diaphragm or piston. This minimum pressure drop is a pressure loss, and means less pressure available at the coil. When using Parker's secondary coolant valves, valve size can be maximized, minimizing the pressure drop.

**The 34E24C2-R1021E is pilot operated and requires a minimum of 5 psi. It uses the AF-4 series coil.*

DISCHARGE BYPASS VALVES

SELECTION PROCEDURES

The selection of a discharge bypass valve, and the necessary companion devices, is simplified ***if complete system information is available.*** This will result in the most economical selection because the components will match the system requirements.

Besides the discharge bypass valve, a specific application may require a hot gas solenoid valve, an auxiliary side connection distributor or ASC adapter, and a desuperheating TEV with a companion liquid line solenoid valve. Once the type of application (review Application Section) is determined, the necessary valves can be selected from the information discussed in this section.

DISCHARGE BYPASS VALVES The selection of a Sporlan Discharge Bypass Valve involves five basic items:

1. **Refrigerant** - valve capacities vary considerably for different refrigerants.
2. **Minimum allowable evaporating temperature at the reduced load condition** - depending on the system, this value must be set to prevent coil icing and/or compressor short cycling. For example, this may be 32°F - 34°F for a water chiller; 26°F - 28°F for a normal air conditioning system; and, the freezing temperature of the specific product for a refrigeration system.
3. **Compressor capacity (tons) at minimum allowable evaporating temperature** - consult compressor capacity ratings for this value.
4. **Minimum evaporator load (tons) at which the system is to be operated** - most systems are **not** required to operate down to zero load but this value will depend on the type of system. For example, most air conditioning systems only need to operate down to 15-25% of full load. However, air conditioning systems for data processing and "white" rooms, and most refrigeration systems may be required to bypass to zero load conditions.
5. **Condensing temperature when minimum load exists** - since the capacity ratings of the bypass valves are a function of condensing temperature, it is vital that proper head pressure is maintained, especially during low load operation. As the capacity table indicates, a condensing temperature of 80°F is considered the minimum allowable for satisfactory system operation. See Bulletin 90-30 for information on Sporlan's Head Pressure Control Valves.

The discharge bypass valve must be selected to handle the difference between items 3 and 4 above. If the minimum evaporator load (item 4) is zero, the hot gas bypass requirement is simply the compressor capacity at the minimum allowable evaporating temperature (item 3). The following discussion on Capacity Ratings and the Example show how these factors affect a selection on a typical air conditioning system.

Capacity Ratings – As the Discharge Bypass Valve Capacity Table indicates, valve ratings are dependent on the evaporating and condensing temperature ***at the reduced load condition*** and the refrigerant used. Therefore, once this information and the hot gas bypass requirement in tons is determined, a discharge bypass valve can be selected.

Where two valve capacities are shown for the same conditions — one for the 0/30 adjustment range and another for the 0/80 adjustment range — the "0/30 psig" valve should be used because of its greater capacity. Both values are listed as an aid in selecting a valve for a system with operating conditions between those shown.

As the capacity table heading indicates, these are ***valve*** capacities, ***not*** the system capacity on which the valve is applied. The ratings are the sum of the hot gas bypassed and the liquid refrigerant for desuperheating, regardless of whether the liquid is fed through the system TEV or the auxiliary desuperheating TEV. The capacities are based on an evaporator temperature change of 6°F from a closed position to the rated opening. This is a nominal rating value based on years of application experience. Since a discharge bypass valve is actually a ***pressure*** regulating valve, it should be pointed out that the capacity ratings based on a 6°F evaporator temperature change take into account that a 6°F change @ 40°F on Refrigerant 22 is a 9.1 psi change, while on Refrigerant 12 it is only 5.7 psi. The 6°F nominal change is used so all the various pressure changes do not need to be shown in the table. If additional capacity is required and a greater evaporator temperature change can be tolerated, these valves are capable of opening further. The following table lists various capacity multipliers for this purpose. For example, an ADRHE-6-0/80 rated for 9.58 tons at a 26°F evaporating temperature will start to open at 32°F (26° + 6°); and, when the evaporating temperature has dropped to 26°F, the valve will be open far enough to bypass 9.9 tons of hot gas. If a temperature change of 8°F can be tolerated, the valve would start opening at 34°F (26° + 8°) and be open far enough to bypass 9.9 times 1.15 or 11.39 tons of hot gas.

Occasionally, a bypass valve is selected for an evaporator temperature change of less than 6°F. Multipliers for those situations are also given in the table below.

	22, 402A, 404A, 407C, 507	1.34	1.27	1.25	

Example – Select a discharge bypass valve for a 30 ton Refrigerant 22 air conditioning system with 67% cylinder unloading (4 of 6 cylinders unloaded). Normal operating conditions are 45°F evaporating temperature and 120°F condensing temperature with a ***minimum*** condensing temperature of 80°F due to head pressure control.

When the evaporator load drops below the last step of cylinder unloading, it is necessary to keep the system on-the-line to maintain proper space temperatures, and avoid frosting of the coil. From the compressor manufacturer's capacity table, the compressor capacity in tons at the minimum allowable evaporating temperature is approximately 10 tons. If the system had to be on-the-line down to zero load, the bypass valve would have to bypass 10 tons of hot gas. With the necessary system factors — R-22, 26°F evaporating temperature at the reduced load condition, and 80°F condensing temperature — the capacity table is checked for a valve which can handle the ***10 tons bypass capacity:***

The DRHE-6-55/70 AR has a capacity of 13.1 tons at these conditions. Therefore, if the system must operate to zero load, this would be the proper selection.

However, if the minimum evaporator load is 4.5 tons (15% of total system capacity), an ADRPE-3-0/80 would be the proper selection (valve capacity of 4.86 tons). The only additional information necessary is the valve connections. While various connections are available, the proper valve connections must be selected to match the system's piping requirements.

DISCHARGE BYPASS VALVES

Operation

Direct Acting Valves — HGBE-5

Sporlan DBVs respond to changes in downstream or suction pressure. See Figure 7. When the evaporating pressure is above the valve setting, the valve remains closed. As the suction pressure drops below the valve setting, the valve responds and begins to open. As with all modulating type valves, the amount of opening is proportional to the change in the variable being controlled — in this case the suction pressure. As the suction pressure continues to drop, the valve continues to open until the limit of the valve stroke is reached. However, on normal applications there is not sufficient pressure change to open these valves to the limit of their stroke. The amount of pressure change from the point at which it is desired to have the valve closed, to the point at which it is to open, varies widely with the type of refrigerant used and the evaporating temperature. For this reason Sporlan DBVs are rated on the basis of allowable evaporator temperature change from closed position to rated opening. For direct acting valves, a 6°F (3.3°C) change is considered normal for most applications and is the basis of our capacity ratings. Multipliers for other temperature changes are given in the Selection Procedures section.

Desuperheating Thermostatic Expansion Valves

For information on desuperheating thermostatic expansion valves visit our website at www.sporlan.com and reference Bulletin 90-40 or consult Sporlan Division of Parker, Washington, MO.

Adjustment Ranges Pressure Setting

Adjustable Spring Heads on Direct Acting Valves

The adjustable type utilizes a spring assembly which can be fixed at the desired pressure setting (opening pressure). This setting will not be affected by other factors such as ambient or hot gas temperatures. The HGBE-5 is available with an adjustment range of 95/115 psig (6.6/7.93 bar). The standard factory setting for this valve is 105 psig (7.24 bar).

Pilot Operated Valves

The HGBE-8 is adjustable from 75 to 150 psi (5.2 to 10.3 bar). The standard factory setting is 110 psig (7.58 bar). Adjustment is made by turning the adjustment screw on the pilot valve. Turning this screw clockwise will increase the valve's setting and a counterclockwise rotation will decrease the valve's setting.

Adjusting these valves can be complicated because the load must be varied during the setting procedure. The load on the system must be decreased to lower the suction pressure so that the valve can control. The valve should then be adjusted to maintain the desired pressure. The load on the system should then be increased to raise the suction pressure above the valve setting to close the valve. Once this is accomplished, the valve setting can be checked by slowly decreasing the load until the discharge bypass valve begins to open (a hissing sound and/or an accompanying pressure rise at the outlet connection will indicate that the bypass valve has opened).

HEAD PRESSURE CONTROL VALVES
SPORLAN

Sporlan Head Pressure Control for systems with air cooled condensers can be accomplished with any of the three valve combinations - the ORI/ORD, the OROA-5 and the LAC-4. The non-adjustable ORD-4 is used with the adjustable ORI valves. All valves have been designed specifically for head pressure control.

CAPACITIES - Ratings for the common refrigerants are given at several pressure drops for the ORI's, OROA, and LAC below. Maximum capacities for the ORD-4 are given below also. Normally, a 2 psi pressure drop across the ORI or OROA is recommended; however, this can be exceeded provided the total pressure drop through the condenser and ORI or OROA does not exceed 14 psi.

HEAD PRESSURE CONTROL VALVES
SPORLAN R410A

Selection Procedures

The actual selection of Sporlan Head Pressure Control Valves involves four basic items:

1. System capacity in tons
2. Refrigerant
3. Minimum ambient design temperature
4. Allowable pressure drop across the valve

When selecting these valves it is necessary to consider the valve's capacity when it is controlling at the minimum ambient design temperature. The minimum ambient design temperature is a factor because the bypassed discharge gas must heat the subcooled liquid leaving the condenser to maintain the receiver pressure. This subcooled liquid will approach the ambient temperature. It is the flow of the discharge gas and liquid mixture flowing through the valve at the minimum design ambient conditions that will determine the valve's capacity. Once the valve's capacity and pressure drop have been determined at minimum design ambient conditions, the capacity of the valve during high ambient conditions should be checked to determine the pressure drop of the valve with full liquid flow.

Example: Select a LAC valve for a 10 ton (35 kW), R-410A unit with a minimum design ambient temperature of -20°F (-28°C). The LAC-10 has a capacity of 12.8 tons (47.3 kW) at a 5 psi (0.35 bar) drop across the valve according to the Low Ambient Capacity table below. The LAC-10 also has a capacity of 11.4 tons (49.6 kW) at a 2 psi (0.21 bar) drop across the valve according to the High Ambient Capacity table below. The LAC-10 is the correct selection.

Capacities are calculated in accordance with ASHRAE Standard 158.2, "Methods of testing Capacity of Refrigerant Pressure Regulators". Capacities are based on 90°F Liquid Temperature entering the expansion valve and 25°F superheated vapor entering the compressor.
ORIT-6 and ORIT-10 are rated based on a valve setting 8 psi lower than the Evaporator Design Temperature for the 0/50 psi adjustment range, and 12 psi lower for the 30/100 psi adjustment range.

Capacities are calculated in accordance with ASHRAE Standard 158.2, "Methods of testing Capacity of Refrigerant Pressure Regulators". Capacities are based on 60°F Liquid Temperature entering the expansion valve and 25°F superheated vapor entering the compressor.

**Capacities are calculated at 1 psi ΔP when common suction and circuit evaporator temperatures are the same. For capacities at conditions other than those shown in the tables, use Sporlan Selection Program or contact Sporlan Headquarters.*

Capacities are calculated in accordance with ASHRAE Standard 158.2, "Methods of testing Capacity of Refrigerant Pressure Regulators." Capacities are based on 60°F Liquid Temperature entering the expansion valve and 25°F superheated vapor entering the compressor.

**Capacities are calculated at 1 psi ΔP, when common suction and circuit evaporator temperatures are the same. For capacities at conditions other than those shown in the tables, use Sporlan Selection Program, or contact Sporlan Headquarters.*

Electric Evaporator Control Valves - CDS-4, -7, -9, -16 and -17

The CDS valves are designed for more precise and energy efficient control of temperatures in evaporators. Proper temperature is obtained by regulating refrigerant flow in the evaporator in response to signals generated by an electronic controller and sensor combination. The valves are built around balanced ports, which allows input power of only 4 watts, less than one quarter of the power used by older heat motor and analog designs. When not actively stepping, power to the motor is removed for further energy savings. The step motors used are standard 12-volt DC bipolar designs, which in concert with the integral gear reduction, give the valves unsurpassed accuracy and repeatability over the entire operating range. Since the valves are powered from an external controller, no pilot lines or high to low side bleeds are required. The properly applied CDS valve and controller can replace standard mechanical evaporator pressure regulators (EPR), suction stop solenoid valves, and conventional thermostats.

All CDS valves may be applied as head pressure control, or liquid line differential valves for R-744. Contact Sporlan for more information. All Sporlan CDS valves are rated at 620 psig (42 barg) MRP.

Simplified cartridge design allows all moving parts to be replaced as a unit. Only the valve body is left in the line. This will allow maintenance or repair without unsweating the entire valve.

***Note: CDS"T" indicates a 1/4" access fitting on the EPR valves.**

Controller Packages

TCB Temperature Control Board / IB Interface Board

The TCB interface/controller was designed to allow all Sporlan step motors to be modulated in response to an externally generated signal. The IB and TCB will accept a 4-20 milliamp, or 0-10 volt DC inputs and will stroke the valve in proportion to that signal. The TCB and IB will allow use of the CDS valves with an existing DDC system or other generic temperature controller for hot gas bypass, evaporator temperature, or reclaim applications. **While the TCB and IB will also control Sporlan's line of SER and SEI step motor electric expansion valves, an external signal must be generated in response to superheat and not simply temperature. Please contact Sporlan for more information.**

When the TCB is purchased with optional set point potentiometer and sensor, the TCB becomes a stand alone single point temperature control for the CDS valves. The sensor is installed in the air stream or affixed to the pipe containing the liquid to be controlled.

SMA-12 Step Motor Actuator

The SMA-12 is an instrument designed to help diagnose systems with step motor valves by proving operation of the step motor. The unit is powered by two 9 volt alkaline batteries and will power any standard 12-volt DC bipolar step motor. Step rate is selectable at 1, 50, 100 or 200 steps per second and will stroke the motor in both the open and closed directions. Red lamps indicate continuity of the motor windings and battery power, and binding posts are provided for quick connection of the motor leads. In the event of a controller failure, the SMA-12 can be used to manually open or close the valve or manually step it to any position. The SMA-12 is the basic troubleshooting tool for all step motor valve operated systems.

CONVERSION KITS

The (S)ORIT-12, -15 and -20 Evaporator Pressure Regulating Valves were developed by Sporlan as the first of a new generation of evaporator pressure regulators. The (S)ORIT series of valves are mechanical regulators which use highside system pressure as a source of operating power. They were developed specifically for systems where accurate control and minimum pressure drop are important requirements.

The CDS valves are electronically operated step motor evaporator pressure regulating valves. Synchronized signals to the motor provide discrete angular movement, which translates into precise linear positioning of the valve piston. Valve pistons and ports are uniquely characterized, providing superb flow resolution and performance. The CDS valves are easily interfaced with microprocessor based controllers, including Sporlan supplied controllers.

Since supermarket equipment is evolving towards electronic control, Sporlan has created a product to allow update of the older mechanical (S)ORIT Evaporator Pressure Regulator (EPR) valves to CDS style Electric Evaporator Pressure Regulator (EEPR) valves.

FEATURES AND BENEFITS

- No need to remove the existing SORIT or ORIT-12, -15 or -20 valve body from the piping
- Economical equipment update, fast installation
- Step motor for precise control
- Tight seating for defrost and pumpdown application
- No pilot gas flow required
- Increased efficiency
- No pressure drop required for operation
- Field proven reliability
- Sporlan quality

ORDERING INSTRUCTIONS

The CDS-16 is the only angled valve. The CDS-4, CDS-7, CDS-9 and CDS-17 are straight through valves.

ELECTRONIC TEMPERATURE CONTROL SYSTEM

SPORLAN A-8/SPORT/A-9 VALVES TO CDS

FEATURES AND BENEFITS

- Converts a mechanical A8, SPORT or A9 valve to a stepper motor driven modulating valve
- Eliminates the need for brazing, because the existing A8, SPORT or A9 valve body stays in the system piping
- Economical system upgrade opportunity, with a typical 30 minute valve installation
- Reduces the external seal surface area
- Improves performance and system efficiency
- No manual setting or adjustment required
- Tight seating for defrost and pumpdown applications
- No pressure drop required for operation
- Field proven reliability and Sporlan quality

For nearly a decade, Sporlan has offered an innovative and economical method to convert currently installed SORIT Evaporator Pressure Regulators into stepper motor driven CDS valves. After tens of thousands of successful conversions and in response to growing demand for more productivity and efficiency tools, Sporlan is pleased to offer the next generation of CDS Conversion Kits. Now it is possible to convert nearly all A8, SPORT and A9 Pressure Regulators into Sporlan stepper motor valves using only one of four kits, and the retrofit has never been easier.

By utilizing the existing A8, SPORT or A9 valve body, there is no brazing required to complete the conversion, saving considerable time and expense. The conversion kit reduces the seal surface area of the installed valve, making this an ideal upgrade opportunity versus a seal rebuild, or even as a full store scheduled retrofit. Once the retrofit is complete, you will find that the solution pays for itself through improvements in system performance, and through future serviceability and diagnostic capabilities.

Review Installation Instruction SD-399 for A8/SPORT and SD-420 for A9 valves for step by step instructions to complete a typical conversion. And for easy implementation and optimal performance, make sure to pair your Conversion Kit with a Sporlan Pressure or Temperature Control.

OIL LEVEL CONTROL SYSTEM

SPORLAN

Sporlan's Oil Level Control System Components were developed to offer the refrigeration industry an oil level control system of the highest quality. The heart of the system is the Oil Level Control which when matched with the Oil Reservoir and Oil Differential Check Valve maintains a minimum oil level in the compressor crankcase during all phases of system operation.

Oil Reservoir Type OR-1-1/2

The Sporlan Oil Reservoir (OR-1-1/2) is a holding vessel to contain the oil that is not within the crankcase, the oil separator, or in circulation. The OR-1-1/2 has an inlet and an outlet service valve so it may be isolated from the rest of the system, or the oil supply from the oil reservoir to the Oil Level Control can be eliminated for service.

Oil Level Controls

The purpose of the Sporlan Oil Level Control is to regulate the flow of oil to the compressor crankcase to maintain a minimum oil level as specified by the compressor manufacturer for any given application.

REFRIGERANT DISTRIBUTORS & AUXILIARY SIDE CONNECTORS

SPORLAN – For use with all refrigerants

Auxiliary Side Connectors

ASC-4-3, ASC-5-4, ASC-7-4, ASC-9-5, ASC-11-7, and ASC-13-9

For proper distributor type, order by complete Sporlan type listed below. E.g., an 1126 distributor requires an ASC-11-7 Auxiliary Side Connector. **Do not use an ASC that is smaller or larger than recommended. Bushing up or down at the outlet defeats the purpose of the internal nozzle tube extension. Do not use an ASC on distributors with permanent nozzles.**

Ordering Instructions

Distributors must be ordered with the complete designation: model, number and size of circuits, orifice size, and number and size of the side connection (1650 series only). Example, 1651-2-1/4-2 with one 3/8" OD side connection. The ASC designation is specified as shown above to match with the appropriate distributor. Do not attempt to use an ASC that is smaller or larger than recommended. Bushing up or down at the outlet will defeat the purpose of the internal nozzle tube extension.

Important

When adding an ASC to the solder type distributor, the nozzle must be moved from the distributor to the ASC. When the ASC-H-7 and ASC-M-9 are used the ER or CR nozzle replaces the conventional nozzle.

Introduction

The Sporlan Electronic Refrigeration Controller System (RCS) is a microprocessor-based system to precisely control refrigeration evaporators in walk in coolers and freezer applications. Its state-of-the-art design accurately controls refrigerant flow into the evaporator by means of a Sporlan Electric Expansion Value (EEV). By using precision pressure and temperature sensor inputs, the RCS is able to control evaporator temperature sensor inputs, the RCS is able to control evaporator temperature more accurately and consistently than the mechanical thermostatic expansion valves that are employed in traditional systems.

LINE VALVES

SUPERIOR VALVE

Line Valves - Diaphragm Packless Valves

All diaphragm packless valves contain metal diaphragms and backseat metal to metal when the valve is fully open. Controlled stem travel assures life-time diaphragm performance; balanced bearing surfaces and polished stem heads eliminate wear and assure smooth, easy operation. Flow is unrestricted. Because of their unique construction, Superior diaphragm packless valves can be soldered into the line without disassembly.

Type 802B Check Valves - Horizontal or Vertical Installation

The internal parts can easily be removed and reassembled after soldering. This basic "Y" type design reduces pressure drop to a very low level. The seat insert is made of teflon. A specially designed secondary seat backs up the primary seat, after approximately 10000 cycles of operation the secondary seat becomes effective. This is done to insure even better shut-off characteristics as the valve gets older. These valves may be installed in any position except upside down.

DUAL PRESSURE RELIEF VALVE ASSEMBLY

Series 3155W

With the concerns over the release of refrigerants to atmosphere, dual pressure relief valves have become more common and mandated in many jurisdictions. The advantages of this device is twofold. Firstly, a pressure relief valve can now be changed when activated without having to recover the refrigerant from the system. Secondly, the contractor can easily replace the activated PRV easily and doesn't have to worry about being without a safety on the system.

CHECK VALVES

REFRIGERANT HEAT EXCHANGERS

PACKLESS

Intended for application on refrigeration systems to transfer heat between liquid refrigerant leaving the condenser on the high pressure side of the system and refrigerant vapor leaving the evaporator on the low pressure side of the system. This heat transfer may be desirable for several reasons:

(a) To raise the vapor temperature to prevent frosting or condensation on the suction line
(b) To evaporate any remaining liquid in the vapor stream to prevent possible compressor damage
(c) To subcool the liquid to prevent flash gas in the liquid line
(d) To increase system refrigerating capacity

SUCTION ACCUMULATORS
REFRIGERATION RESEARCH

Suction Accumulators

Air conditioning, heat pump, truck refrigeration and many other applications require intermittent operation of the refrigeration compressor. Especially in remote applications, the suction line may trap or hold quantities of liquid which are suddenly dumped into the compressor as it starts up. This is frequently the cause of broken valves, pistons, broken or bent connecting rods, blown gaskets and bearing washout.
Proper installation of the Refrigeration Research suction accumulator in the suction line, just before the compressor, eliminates damage. If correctly sized, relatively large quantities of liquid refrigerant may return through the suction line and the suction accumulator prevents damage to the compressor. Liquid is temporarily held in the suction accumulator and metered back to the compressor along with any oil, at a controlled rate, through the metering orifice. Therefore, damage to the compressor is prevented and the compressor immediately and quietly goes to work.
The actual refrigerant holding capacity needed for a suction accumulator is governed by the requirements of the particular application. There is a great variation in refrigeration systems and this must be considered. Where possible the capacity selected should be checked by actual test. Normally the accumulator should not be sized for less than 50% of the total system capacity.

MUFFLERS
REFRIGERATION RESEARCH

Some systems are noisy due to vibration and pulsation of gas through the discharge line. To smooth out pulsations and reduce vibration and noise, Refrigeration Research offers the industry's most complete line of Discharge Mufflers.

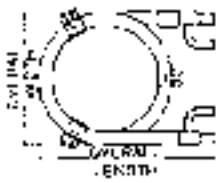

The "MH" Series of discharge mufflers are uniquely designed for the higher pressure requirements for systems using R-410A. The tough requirements needed for these special models are made to the approved UL requirements necessary to meet the 675 p.s.i.g. working pressure.

ICE UV MINI™

Think Small

There can be too much of a good thing! Because the 10-watt UV-C lamp in ICE UV™ may be too powerful for use in most countertop ice & water dispensers we've introduced ICE UV Mini™ which features a pencil-thin 4-watt UV-C lamp and a compact power supply.

Individually packaged units are designed specifically for boiler-tower closed loop applications. Each unit can be operated year 'round in heating or cooling mode, providing zone control and independent operation. This makes them ideal for multi-story stuctures such as office buildings, as well as single story facilities such as nursing homes and schools. Individual units are connected by a water loop which transfers energy into and out of the individual units. Larger sizes are available, please see your local RSL Branch for more information

Available voltages: 208/230-1-60, 208/230-3-60, 460-3-60, 575-3-60, 265-1-60, although all models are not available in all voltages. See HB Engineering Design Guide or Price Sheet for complete part number list.

All units available in right or left return.

See Engineering Design Guide for Ground Water/Ground Loop performance data.

FRIEDRICH

NEW DESIGN FOR HIGER ENERGY EFFICIENCY

ULTRA QUIET PERFORMANCE / EXCLUSIVE 3 SPEED FAN / UNIVERSAL HEATER

NEW TWO MOTOR DESIGN

With separate indoor and outdoor motors, the indoor motor can run at slower speeds which reduces sound levels indoors.

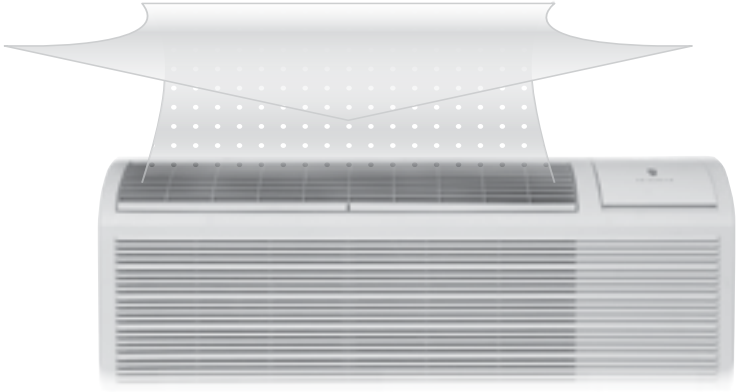

NEW TANGENTIAL BLOWER WHEEL

Tangential blower wheel has nearly 5x the surface area of a typical fan used on other PTACS. The result is more uniform airflow over a wider path for faster, more even air distribution throughout the room and improved sound levels.

Air is blown over the entire length of the tangential wheel into the room in a uniform laminar airflow.

TANGENTIAL BLOWER WHEEL PROVIDES UNIFORM LAMINAR AIRFLOW OVER A WIDE PATH FOR FASTER, MORE EVEN AIR DISTRIBUTION THROUGHOUT THE ROOM WITH IMPROVED SOUND LEVELS.

UNIQUE 3 SPEED FAN

Friedrich is the only major PTAC brand with 3 fan speeds in cooling and heating mode.

Soft start/stop fan delay feature reduces transitional noise that is usually associated with compressor start-up.

DIGITAL CONTROLS WITH UNIQUE 3 SPEED FAN

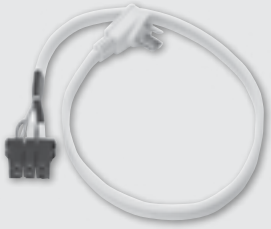

UNIVERSAL HEATER / POWER CORD

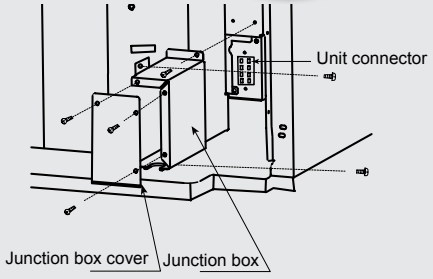

All PTAC units ship complete with the standard power cord for that model (7K,9K and 12K = 3.0 kW and 15K = 5.0 kW). If you want to adjust the heater size on any PTAC unit simply unplug the attached power cord and connect the desired size. It is important to ensure that all wiring and building connections are sized properly for the power cord as well.

Universal heater allows installers to change the heat output of the PTAC by changing the power cord, simplifying ordering and installation.

For distributors, this means stocking one PTAC model and the 2 optional cords in place of 3 separate PTACs.

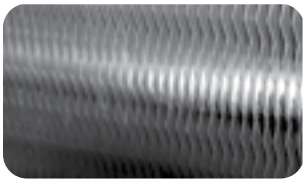

POWER CORD IS AS EASY TO CONNECT AS A PHONE JACK

IDEAL SOLUTIONS FOR:

- Hot & cold regions where homeowners want to enjoy a reliable, energy efficient source of heating and cooling
- Cold regions where homeowners want to enjoy a reliable, energy efficient source of heat
- Renovations, remodeling and new construction
- Sun rooms, basements, garages, hot or cold rooms, attics where the walls tend to be lower, or wherever wall space is at a premium
- Ceiling void or attic does not allow for a viable duct run option

Daikin AURORA heat pump for extreme weather conditions

Up to 100% rated heating capacity at 5ºF WB (-15ºC WB) and confirmed continuous operation, as low as -13ºF WB (-25ºC WB) ambient temperature.

Auto - Restart

The unit memorizes the operation mode, airflow and temperature settings. Should there be a power failure when the unit is in operation, it will automatically return to the same operating conditions when the power is restored.

Titanium Apatite Photocatalytic Air Purifying Filter

This filter combines the air-purifying filter and titanium apatite photocatalytic deodorizing filter in a single highly effective unit.

Comfort Mode

Comfort Mode operation improves comfort. When cooling, the flap positions itself horizontally to prevent cold airflow from being blown directly onto the body. When heating, the flap turns vertically downwards to drive warm air to the bottom of the room.

Hot Start

(Heat Pump) When the heating operation starts or when the unit changes from cooling to heating, there is no cold draft

Powerful Operation Mode

Pushing the POWERFUL button on the remote control gives you a boost in cooling or heating power for a 20-minute period, even if the unit is already operating at high capacity.

3 Installer must supply one or two PVC pipes: one for combustion air (optional) and one for the flue outlet (required). Vent pipe must be either 2" or 3" in diameter, depending upon furnace input, number of elbows, length of run and installation (1 or 2 pipes). The optional Combustion Air Pipe is dependent on installation/code requirements and must be 2" or 3" diameter PVC.

4 Minimum Circuit Ampacity = (1.25 x Circulator Blower Amps) + ID Blower amps. Wire size should be determined in accordance with National Electrical Codes. Extensive wire runs will require larger wire sizes.

5 Maximum Overcurrent Protection Device refers to maximum recommended fuse or circuit breaker size. May use fuses or HACR-type circuit breakers of the same size as noted.

NOTES

- All furnaces are manufactured for use on 115 VAC, 60 Hz, single-phase electrical supply.
- Gas Service Connection ½" FPT
- Important: Size fuses and wires properly and make electrical connections in accordance with the National Electrical Code and/or all existing local codes.
- For bottom return: Failure to unfold flanges may reduce airflow by up to 18%. This could result in performance and noise issues.
- For servicing or cleaning, a 24" front clearance is required. Unit connections (electrical, flue and drain) may necessitate greater clearances than the minimum clearances listed above. In all cases, accessibility clearance must take precedence over clearances from the enclosure where accessibility clearances are greater.

SAMSUNG VRF SYSTEMS

SAMSUNG

HVAC. Built brave.

With VRF, the facts speak for themselves.

As a residential contractor, you need trustworthy products that really appeal to and benefit homeowners. Say hello to the Samsung DVM S Eco lineup, now featuring Heat Recovery: an extremely flexible, whole home, Variable Refrigerant Flow (VRF) solution that conventional systems simply can't rival.

What is VRF? Variable Refrigerant Flow systems, like mini split systems, utilize advanced digital inverter technology and refrigerant piping to connect the indoor and outdoor unit. However, VRF systems can connect multiple indoor units to a single outdoor unit to create multiple zones. Instead of setting one temperature for the entire house, zoning a home with a VRF system allows homeowners to control the areas where they spend the most time and turn off others to save energy.

It's perfect for homeowners looking to upgrade their current system or when installing an energy-efficient system in new construction. How so? Let's get down to the facts.

1 It's extremely quiet.

The DVM S Eco is definitely the quiet type. This VRF system provides optimal levels of comfort while creating minimal amounts of noise. Furthermore, its quiet operation at night creates a restful environment. Thanks to VRF, homeowners can have peace and quiet at last.

2 It delivers high efficiency.

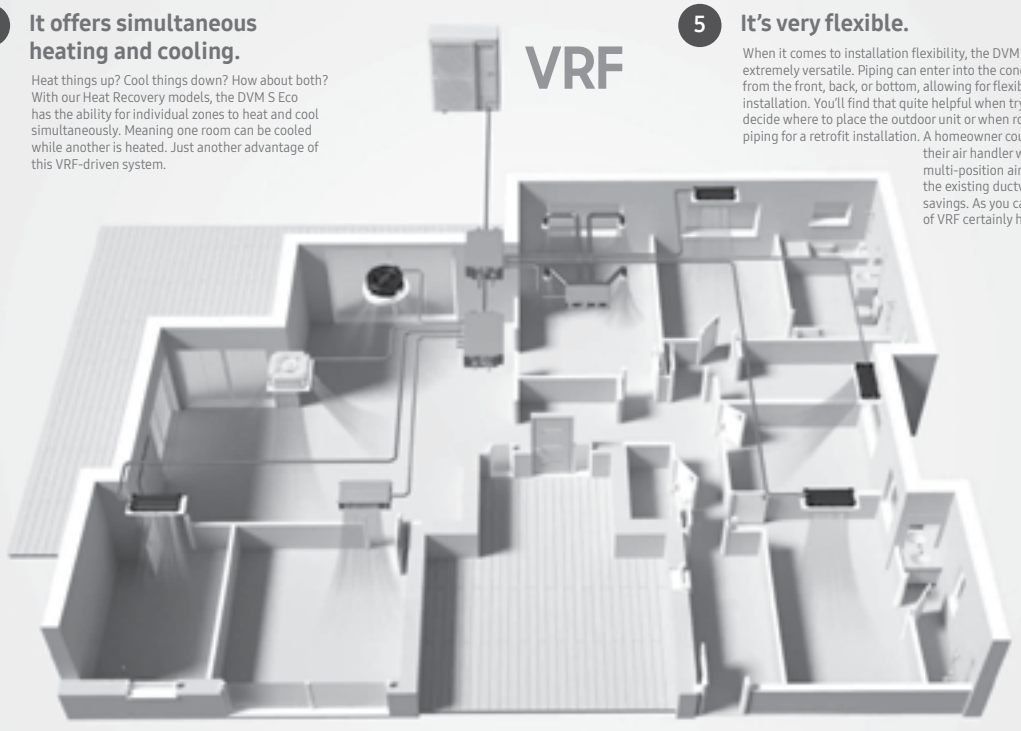

Eco-conscious? Check. Budget-conscious? Check. Using advanced compressor technology, this VRF system offers exceptional heating and cooling performance at a minimal cost. Exactly what homeowners are looking for? Check.

3 It provides zoned heating and cooling.

The DVM S Eco offers the ultimate zoning solution. With our Heat Pump models, the DVM S Eco allows for precise temperature control in multiple zones, providing comfort to a wide range of occupants.

4 It offers simultaneous heating and cooling.

Heat things up? Cool things down? How about both? With our Heat Recovery models, the DVM S Eco has the ability for individual zones to heat and cool simultaneously. Meaning one room can be cooled while another is heated. Just another advantage of this VRF-driven system.

5 It's very flexible.

When it comes to installation flexibility, the DVM S Eco is extremely versatile. Piping can enter into the condenser from the front, back, or bottom, allowing for flexible installation. You'll find that quite helpful when trying to decide where to place the outdoor unit or when routing piping for a retrofit installation. A homeowner could also replace their air handler with a Samsung multi-position air handler and keep the existing ductwork, creating major savings. As you can see, the flexibility of VRF certainly has its benefits.

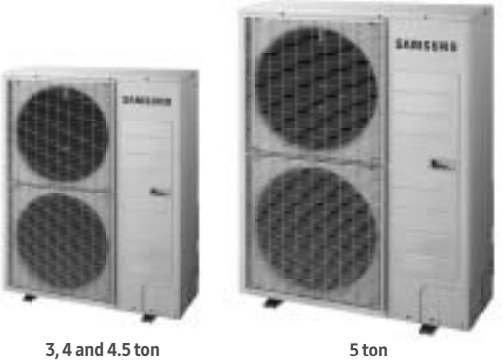

So give VRF a chance with Samsung. You'll get highly enticing, highly efficient products that fit residential applications. And that's a fact. Check out SamsungHVAC.com to learn even more.

SMALL SUBMERSIBLES

Oil-Filled:

These pumps feature an oil-filled motor housing with a radial lip seal on the motor shaft. They have an exceptional life expectancy because oil serves as a continuous lubricant for all the moving parts and the shaft seal. This non-toxic dielectric oil, often paired with an aluminum, cast iron or plastic housing, also helps dissipate the heat build-up found in a continuous-running pump.

KE2 Edge Manager & KE2 Wireless Sensors

The KE2 Edge Manager is similar to the KE2 LDA communication device with several features that make it unique, including easily creating a common dashboard that integrates KE2 sensor data with in-depth system operational information from KE2Therm controllers.

The KE2 Edge Manager provides real-time data tracking, storing, and uploading. And, while many monitoring options force users to store their data on the provider's "cloud," with the KE2 Edge Manager, local access is FREE - the user owns their data.

Plus, accessing the data has never been easier. The KE2 Edge Manager lets users access data locally, on their network, using their own "cloud" portal, or via the secure KE2 Portal.

The KE2 Edge Manager, when used with KE2 Wireless Sensor technology provides the feasibility to remotely monitor and receive alarm notifications in almost any refrigeration application – from warehouses, to walk-ins, reach-ins, cold rails, under counter and more.

ELECTRONIC LUBE OIL CONTROL

The P545 Series Electronic Lube Oil Control is designed for use on refrigeration compressors equipped with an oil pump that accepts single-point differential pressure transducer. The P545 senses net lube oil pressure and
de-energizes the compressor if lube oil pressure falls below the manufacturers recommendation for longer than the time delay. Front-mount LEDs indicate the status of the lubrication system and a user-selectable time delay can be set to minimize compressor short cycling.

A Johnson Control R10A Current Sensing Relay is also available to prevent the P545 from locking out during normal compressor off cycles.

Features:

- SPDT relay contacts for liquid line solenoid and alarm applications
- Relay contact output for compressor
- Built-in test circuit
- Improved noise immunity
- Selection of anti-short-cycle time delay on loss of power
- User friendly display panel
- Standardized mounting, outer case size and wiring

VFD66 3 Phase Condenser Fan Speed Control

Description

The VFD66 Series Condenser Fan Speed Controls are designed for speed control of 3-phase condenser fan motors in refrigeration and HVAC systems. The VFD66 controls regulate condenser fan motor speed by varying the frequency and voltage of the power supplied to the motor.

The VFD66 controls use input signals from various devices to adjust fan speed and optimize condenser head pressure, especially during low ambient conditions.

Condenser fan speed may be controlled by pressure or temperature. The VFD66 controls accept input signals from the P35 Pressure Transducer, P399 Electronic Pressure Transducer, System 350™ controls or any other device that provides a 0-5 VDC or 0-10 VDC analog input signal.

Applications

The VFD66 controls are intended for air-cooled condenser fan speed control in refrigeration and HVAC applications:

- commercial air-cooled condensers
- cooling tower fans
- fans in evaporative condensing units.

The VFD66 controls allow the system to:

- maintain optimum condenser head pressure in low ambient temperature conditions
- eliminate short cycling in low ambient or changing load conditions
- match the condenser fan speed to the load on the condenser, which increases the efficiency of the refrigeration system. This can reduce electricity cost and help maintain a constant evaporator temperature.

VFD Condenser Fan for Speed Control

Features

- allows use on dual refrigeration circuits cooled by a single fan
- provides installation ease and flexibility
- handles 3-phase motors ranging from fractional to multiple hp at 208/230 VAC or 400/460 VAC

- Versatile, multipurpose, field-configurable control modules and expansion modules designed for global use allow you to create a wide variety of application-specific control systems capable of controlling temperature, pressure, or humidity, or all three conditions simultaneously, with only a small suite of module models.
- Up to three hard-wired input sensors and up to ten relay or analog outputs (in any combination) per control system allow you to build complex custom control systems while reducing your control system cost to only the cost of the required components.
- Control Modules with bright backlit LCDs and four-button touch pad user interfaces provide quick, clear, visual status of your System450 control system inputs and outputs with the touch of a button and enable you to quickly and easily set up and adjust your control system.
- Multipurpose, all-in-one control modules enable simple stand-alone, single-module control systems that are temperature, pressure, and humidity capable out of the box and easy to set up in the field to replace a wide variety of OEM HVACR and process controls.
- An extensive suite of compatible temperature and humidity sensors, and pressure transducers allows you to monitor and control a wide range of HVACR and process conditions in a variety of standard and global units of measurement.
- High input signal selection enables your control system to monitor a temperature, pressure, or humidity condition with two or three sensors (of the same type) and control your system outputs based on the highest condition value sensed by the referenced sensors.
- Differential control enables your control system to monitor and maintain a temperature, pressure, or humidity differential between two sensor points within a system, process, or space.

System 450 Control System with a Control, Power, and Expansion Module

The Reset Control modules have additional features:

- Adjustable minimum and maximum setpoint temperatures (reset control modules only) enable compliance with the manufacturer's specifications for your controlled HVACR and process equipment.
- Selectable shutdown-high and shutdown-low temperature settings (reset control modules only) saves you energy by shutting down controlled equipment when the ambient temperature either rises or drops to a point where heating or cooling is no longer required.
- Real time clock and adjustable setback temperature (reset control modules only) save you energy by setting back heating, cooling, or humidity setpoints during scheduled unoccupied periods (24-hour day, 7-day week schedule).
- User-defined reset control capability (reset control modules only) saves you energy in a wide variety of temperature and humidity reset control applications by adjusting the temperature or humidity control loop, based on changes in ambient outdoor temperature or other uncontrolled condition.

System 450™ Series Modular Controls (Continued)

The Control Modules with Communications have additional features:

- Ethernet communication capability through a built-in web server (Ethernet Control Modules only) allows you to monitor your control system status and set up or change the parameters by means of a direct Ethernet cable connection, through a LAN connection, or over the Internet. The built in web server delivers user-friendly web pages to client browsers on a desktop, laptop, tablet, or smart device.
- The Web page server on Ethernet communication modules provides a simple, intuitive web interface for easy remote monitoring, setup, adjustment and remote monitoring of your control systems across Ethernet networks.
- RS485, RTU-compliant Modbus® network communication capability (Modbus control modules only) enables a head-end RS485 Modbus master controller to read and write control system status and setup parameters to the System 450 Modbus communication control module.
- Password protection for local access (Ethernet and Modbus control modules only) and password protection for remote access (Ethernet control module only) deters unauthorized changes to the control system settings, but allows local and remote monitoring of your control system status.
- Analog output signal limiting features (communication control modules only) allow you to select the rate and condition range at which the control updates the analog output signal, potentially reducing wear on the controlled equipment.
- Binary input with time delay (communication control modules only) allows you to use an external set of dry contacts and selectable time delays to control relay outputs.

PRESSURE CONTROLS
JOHNSON CONTROLS

P470

The P470 electronic pressure control with display is a single-stage, on/off, electronic pressure control with an SPDT output relay. The control may be field set to operate in one of three pressure ranges (0 to 100 psi, 0 to 500 psi, or 50 to 750 psi), as either an open-high or open-low control. The P470 control features a large LCD that displays the sensed pressure and other system-status indicators, as well as the adjustable setpoints in the programming mode. The P470 control has a lockable, 3-button touchpad for adjusting setpoints, and a front panel LED that indicates the output relay status. The P470 control uses a P399 electronic pressure transducer to generate a pressure signal and WHA-P399 wiring harness, which eliminates many of the constraints of capillary-tube control applications.

WATER REGULATING VALVES
JOHNSON CONTROLS

V46 Pressure Actuated Water Regulating Valves

The V46 is a pressure actuated modulating valve that is suitable for use either on closed or open systems. Direct acting valves open on pressure increase. This type of valve is primarily used to regulate the flow of water or glycol to a water cooled condenser on a refrigeration system. Reverse acting valves open on pressure decrease and are generally used for bypass or heat pump application.

Features:

- no close fitting or sliding parts in water passages
- range spring does not come in contact with cooling water
- easy manual flushing, if required
- valve design minimizes chatter or water hammer
- free movement of all parts provide smooth pressure modulation
- refrigerant adjustment is not affected by water pressure
- withstands high hydraulic shock without damage
- 3/8, 1/2 and 3/4 in. valves may be disassembled and reassembled without detaching from the refrigeration system or without pumping down

WATER REGULATING VALVES
JOHNSON CONTROLS

V47 Temperature Actuated Modulating Valve

The V47 is a temperature actuated modulating valve that regulates the flow of water or glycol to maintain a desired temperature. Three temperature ranges for each valve size are available. Many valves come with a removable bypass plug that can be replaced by the bypass orifice provided separately with each valve. Valve action is open on temperature increase. For open on temperature decrease models, contact Application Engineering.

Features:
- no close fitting sliding parts in water passages
- range spring does not come in contact with the cooling water
- easy manual flushing, if required
- valve design minimizes chatter and water hammer

Lube Oil Protection Controls

These lube oil protection controls guard pressure-lubricated refrigeration compressors against major damage due to loss of oil pressure. If adequate oil pressure is lost, the built-in S30 Time Delays Switch starts timing. If the oil pressure does not recover within the set period, the control circuit is opened, stopping the compressor.

Features:

- Alarm circuit standard
- Ambient temperature compensated
- Super Cap capillary protection system
- High impact, non-conductive cover
- Field replaceable switch module
- Manual reset
- Industry standard circuitry and terminal identification

Note: The range is the difference between the crankcase pressure and the oil pump pressure that will energize the time delay switch and lead to shut down. The difference in oil pressure needs to rise 7 PSI above the range to de-energize the time delay switch and prevent eventual shutdown.

A12 Series Constant Cut-In Control

The Ranco A12 Controls provide a constant cut-in feature. The constant cut-in design is generally used to provide an Off-Cycle defrost function. Each time the control cycles off, the control contacts will remain "open" until the evaporator is cleared of any frost that may have accumulated from the previous "On" cycle. The A12 constant cut-in setting will be between 35 and 41 degrees F (See control chart).

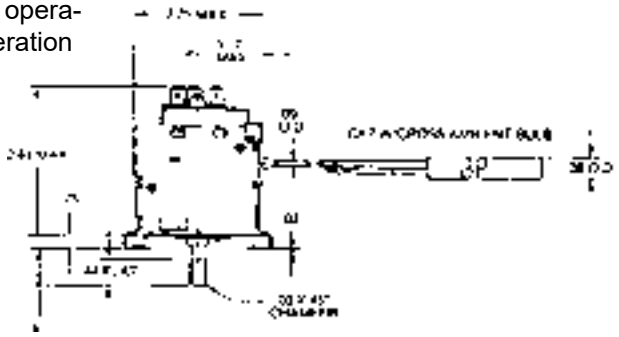

Generally, medium refrigeration units without hot gas or electric defrost systems will use a Constant Cut-In Control. (A12 series)
Rotating the knob/dial changes only the Cut-Out setting. The Cut-In setting remains the same regardless of the knob/dial position.

Type LDK Solenoid Coils For Heat Pump Reversing Valves

CHOOSING THE CORRECT SOLENOID COIL

Type LDK solenoid coils are designed for use with V1-4 / V2-4 / V3-4 / V6-4 / V10-4 / V12-4 RANCO Heat Pump Reversing Valves. These color coded epoxy encapsulated, continuous duty, moisture resistant magnetic coils are designed to operate the pilot valve controlling the Reversing Valves listed above. Included with the solenoid coil is a W29 wiring harness with 48" leads.

WARNING

*Solenoid coils are **not interchangeable**. LDK Series coils must be used with the Vxx-4 Series reversing valves and the L30 Series coils used with the previous version valves listed above.*

HEAT PUMP CONTROLS

RANCO

Timer Activated Heat Pump De-Ice Controls

Provide field-adjustable timer control for de-icing of heat pump outdoor coils. Defrost cycle starts every 30, 45, or 90 minutes. Interlock prevents more than one defrost cycle per time period and temperature must be 28°F or lower to start. Termination temperature is adjustable from 55° to 78°F.

Model Selection Chart:

Part Number	Switch	Voltage	Sensing Element	LIST
E15-2601	SPDT	240	60" Capillary with 5/16 x 4-5/16" Bulb	$539.00

Temperature Activated Heat Pump De-Ice Control

Provides automatic temperature-activated de-icing of heat pump outdoor coils, 120/240 volt operation.

Resistance Heat Thermostat for Heat Pumps

Ranco's C12-2001 Control is an adjustable thermostat which holds back additional stages of supplemental heat until the outdoor temperature falls below the control's setpoint. There are many ways in which the control can be wired into the system. However, the C12-2001 is typically wired through the relay circuit in conjunction with the indoor thermostat. Most indoor thermostats used with heat pumps will complete a circuit to the supplemental heat if the indoor temperature drops approximately 2°F or more below the indoor thermostat's setting.

HEAT / COOL CONTROLS

RANCO

Single Stage Control For Packaged Terminal, Room and Through-The-Wall Heat/Cool Units

This control replaces many OEM controls on heat/cool units. C12-9025 replaces York 026-17371-00 / Heil Quaker 40889-001. C12-9018 replaces Singer / McQuay / Snyder General 02005451 and 02005610.

C12-5010	SPDT	60 to 98	3/4"	3	36" Cap. with 3/8 x 9" Bulb	Dial Plate Knob	$271.30

Two-Stage Heating/Cooling Control

This control replaces many OEM controls on two-stage cooling and heat/cool units. The two SPDT switches are staged 3.5°F.

Model Selection Chart:

Part Number	Switch	Temperature Range (°F)	Differential (°F)	Sensing Element	LIST
C17-100	2-SPDT	71 to 101 (Cooling) 64 to 94 (Heating)	3.5	26" Capillary with 3/8 x 8-9/16" Bulb	$397.00

Discharge Feedback Controls

Discharge feedback thermostats type C17 are replacements for room, packaged-terminal and through-the-wall air conditioning units equipped for either manual or automatic heat/cool changeover. The C17 has separate switches for heating and cooling. A wide energy saving comfort Zone ("dead band") is provided between heating and cooling cycles. A limited adjustment range prevents user from over heating or cooling conditioned space.

Features:

Dual bulb thermostats feature two sensing bulbs. The bulbs respond at the same time to both return and discharge air temperature. A limited adjustment range prevents the user from over heating or cooling space. As a result, room temperature variations are minimized. Comfort is improved and operating costs are reduced.

Control Applications:

These controls are used on Room Air Conditioners, Heat/Cool, Package-Terminal Air Conditioners and Through-The-Wall Air Conditioners - Heat/Cool

VENTILATION CONTROLLERS

HONEYWELL

Honeywell Jade Economizer Demand Control Ventilation (DCV)

JADE™ economizers are the perfect examples of Honeywell innovation that makes saving energy easier for your customers. For buildings with less than 50,000 sq ft and standalone rooftop unit (RTU) applications, JADE is the best solution for a fresh air ventilation system. JADE Fresh Air Economizers with integrated demand control ventilation (DCV) systems are compatible with most individually packaged rooftop or built-up air handling units.

JADE eliminates the complicated set up typically associated with fresh air ventilation systems and can be installed and configured by technicians without significant training. JADE saves time during installation with clear instructions on its LCD display. This display also gives ongoing economizer status indicating whether the economizer is working properly, satisfying ventilation and cooling needs and minimizing energy costs.

Spring Return Damper Actuators

The quickest install or retrofit designed with ease in mind

The ZG-JSL linkage is designed to simplify the attachment of select Belimo actuators to a damper's jackshaft. The unique open ended design allows the linkage to clamp on to any part of a jackshaft measuring from 1/2" to 1.05" in diameter.

Saves time and cost

The ZG-JSL linkage simplifies typical installations and eliminates the difficulties where jackshaft bearings are hard to access. Belimo has simplified installing actuators onto jackshafts, reducing installation time translating into a cost savings. Now with the ZG-JSL linkage, jackshaft installations are done in minutes!

Ideal for tight spaces

The ZG-JSL linkage has a built-in shaft which allows the direct coupling of Belimo actuators. The anti-rotation plate enables the installed actuator to be rotated 90 degrees for space saving applications.

Sizing and Selection

Two-Way Valve, Water Application

Two-position applications — Valve should be line size.

Modulating applications

- Flow characteristic — Equal percentage
- Sizing — ΔP should match ΔP of coil or 3 to 5 psi drop

or use ASHRAE Authority Method

Note: Valve and actuator must meet conditions of service.
Always verify:

- Maximum pressure of body
- Close off pressure rating
- Ambient temperature limits are within valve/actuator limits
- Actuator control circuit matches analog or digital output

Three-Way Valve, Water Application

Two-position applications — Valve should be line size.

Modulating applications

Flow characteristic — Linear

- Constant flow — Valve should be line size or ΔP equal to coil drop
- Variable flow — Size valve for 3 to 5 psi pressure drop or use ASHRAE authority method
- Cooling tower bypass — Size valve according to required pressure drop and flow requirement
- System bypass — Size valve according to required pressure drop and flow requirement

Water Application

Equations: $C_V = \frac{Q\sqrt{G}}{\sqrt{\Delta P}}$

Where Q = Flow in gallons per minute (GPM) required to pass through the valve
G = Specific Gravity of Fluid (Water = 1)
ΔP = Pressure drop across the valve in PSI
C_V = Flow Coefficient

Alternate Forms:

$$Q = \frac{C_V\sqrt{\Delta P}}{\sqrt{G}} \qquad \Delta P = \left(\frac{(Q\sqrt{G})}{C_V}\right)^2$$

$$K_{VS} = \frac{C_V}{1.16}$$

GAS MONITORING DEVICES

BELIMO

HVAC system operation is critical for maintaining adequate safe indoor air quality (IAQ). Belimo gas monitoring systems provide accurate measurement, superior reliability, and easy installation. They can work as a standalone system or seamlessly integrate into major Building Management Systems (BMS). An intelligent peer-to-peer communication protocol allows users to configure and install a complete ventilation control system with only one monitor, or dozens, operating in multiple ventilation zones. The result is the assurance of occupant safety and comfort in buildings.

Belimo's gas monitors provide air quality monitoring for commercial properties. Closely monitoring airborne pollutants to control fresh air ventilation improves the health and wellbeing of occupants, while minimizing excess ventilation, resulting in reduced energy and maintenance costs. Belimo gas monitors are factory calibrated and can monitor up to two gases simultaneously. All monitors feature audible and visual alarms and CAN bus communication, allowing for standalone operation and networking of up to 32 devices. Select models feature relays and analog outputs to control ventilation directly, as well as BACnet MS/TP, allowing for integration into a BMS. The monitors can be easily assigned to groups on site for ventilation zoning on the same network, significantly reducing control wiring and installation time. Gas monitors are wired via a daisy chain and are required to be calibrated annually. All gas monitoring products are backed by a five-year warranty, with the exception of sensor modules, which are backed by a one-year warranty.

- **SEAMLESS INTEGRATION:** Enhanced communication and integration with major building management systems via via BACnet MS/TP with select models.
- **MODULAR DESIGN:** The compact modular design allows for easy instlalation and commisioning to ensure optimal system performance
- **RELIABLE AND DEPENDABLE:** Factory calibrated and designated from the highest quality materials delivering accurate and dependable readings

BLOWER WHEELS

LAU

Lau Universal PRESLOK wheels fit most blowers, regardless of manufacturer.

Basics of wheel replacement (for residential air conditioning or heating equipment):

- Determine if belt driven or direct driven blower
- Measure diameter and width - over the rim
- Determine bore size - measure hub in wheel or shaft diameter
- For direct drive or double inlet wheels

Note: Determine rotation by viewing from hub side

DELAY ON MAKE TIMERS

ICM

APPLICATION	TIME DIAGRAM	MODE OF OPERATION
"Delay ON" General purpose "delay on make" timing function. Ideal for compressor staging and stagger-starting multiple units. Helps to reduce power surges in multiple compressor applications.		When power is applied to the input, the time delay begins. After the time delay is complete, the load energizes and remains energized as long as power is applied. The control is reset by removing power during or after the time delay period.

ICM102

Features and Applications:

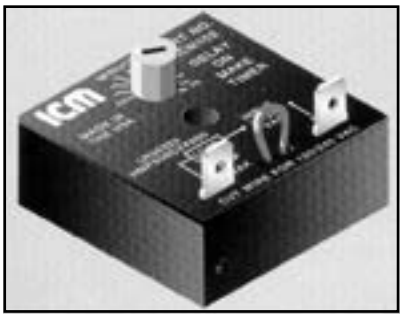

- Universal voltage operation
- Higher, 1.5 amp power rating
- Knob-adjustable time delays
- Works with anticipator-type thermostats
- One model replaces many in field
- Ideal for compressor staging
- Simple, 2 wire hookup
- Compact 2" x 2" package

Specifications

- 18-240 VAC
- 1.5 amps
- 15 amp inrush
- SPST, N.O.
- knob adjustable time delays range .1-600 sec. (10 min.)

Polyol Ester Oil

Polyol ester oil is OEM approved by many compressor manufacturers. On all products the numbers 22, 32, 46, 68, 100, 220 refer to the viscosity of the oil. The letter following the number designates the following:
CF = Copeland formulation
S = Standard solubility
H = High solubility
22 N = Special designation - McQuay
HP = Special for Carrier Internally Geared Chillers

ACID TEST KITS

Nu-Calgon Phase III Refrigeration Oil Test Kit

Disposable test kit that provides proof-positive that acid level in refrigeration oil is safe or unsafe. It can be used on mineral oils, alkylbenzene oils and polyol esters. Phase separation makes it easy to see change in colour of acid indicator (even if a leak detection dye has been added to the oil). Just two bottles to work with. No glass to break open. Simple. Safe. Accurate.

Part #	Size	LIST
4320-W8	1 each	$63.40

Nu-Calgon Rx-Acid Scavenger

A better, more convenient way to neutralize or "scavenge" acid in refrigeration, air conditioning systems...after burnouts or during normal on-going system maintenance. Normal dosage rate is 2 fl. oz. of Rx-Acid Scavenger for every one gallon of system oil...50% less than other acid neutralizing products. This "low treat" feature means far less material has to be added to the system. In addition, the Rx-Acid Scavenger can be used with all lubricants...mineral, alkylbenzene and polyol ester. This means only one product in the tool box or on the truck for all acid neutralizing needs.

TA-1

Design Benefits

- **Builds Customer Confidence –** Show the test results of the acid test kit to customers, or perform the test in their presence. In this way they realize you are using the most up-to-date scientific method for system maintenance. Showing customers the test results will also help to convince them to spend the money necessary to do a proper clean-up job. Customers who are thoroughly confident of your abilities will be more interested in establishing preventive maintenance programs.
- **Accurate and Reliable –** Using a simple, scientific method, you can precisely measure the amount of acid in a lubricant sample taken from a contaminated system. The test procedure has been proven by extensive field experience.
- **Convenient -** The TA-1 has pre-measured solutions supplied in bottles with screw caps for easy handling. Kit may be used on the job site, or a lubricant sample can be saved and tested in the presence of the equipment owner.
- **Lubricant Sample Used for Test –** Since lubricant is the scavenger, it gives the best indication of acid in the system. Less than an ounce of lubricant is required.
- **Quick to Use –** Once the lubricant sample is obtained...it will take only minutes to perform the test. Simply mix the solutions and lubricant to be tested. Shake, and the resulting color tells the complete story.

The TA-1 is normally used on a “pass or fail” basis

For complete information see your Sporlan Wholesaler, our website at www.sporlan.com, or write Sporlan and request Bulletin 40-10.

REFRIGERANT LEAK SEALANT

Nu-Calgon A/C EasySeal

A/C EasySeal is designed to prevent as well as repair leaks anywhere in the system, including condensers, evaporators, copper lines, and soldered joints. It is easily injected into the system, traveling with the refrigerant, searching for leaks. The fact that A/C EasySeal travels with the refrigerant is very important to its ability to find leaks faster, using less sealant than those sealants designed to mix and travel with the systems oil.

- Prevents refrigerant leaks and seals existing leaks in air conditioning and refrigeration systems permanently
- Eliminates expensive leak search and repair
- Travels with refrigerant to find leaks fast
- Utilizes a reusable hose

Diversitech Flex Inject Sealant

With no tools or gauges required, the Flex Inject sealant works by traveling through the system with the oil and refrigerant fixing leaks immediately. Flex Inject works with all compressors, heat pumps, condensers, and other system components and it will not plug up manifold gauges, metering devices, thermostatic expansion valves (TXVs), pistons or cause cap tube blockages. It meets the ASHRAE ARI 700 refrigerant standard and is compatible with any refrigerant including R-410A with no pump downs or recoveries required. Flex Inject is suitable for use in aluminum and copper coils and is microchannel friendly.

HONEYWELL ANALYTICS

301C Controller

Designed for simple installation and operation, the 301C continuously monitors and controls toxic gases, combustible gases and oxygen hazards. Using an addressable RS-485 Modbus communication protocol, the 301C uses daisy chain wiring requiring only 2 pairs of wires to connect up to 96 transmitters on the 3 input channels. This simplifies installation, in turn lowering costs. The 301C's zoning and averaging abilities significantly reduce operational and maintenance costs.

Features:

- User friendly with zero maintenance
- Low installation costs
- Automatic quick self-test and warm-up

301EM Expansion Module

301EM Expansion Module acts as a controller for up to twenty remote refrigerant sensors and detects a wide variety of gases.

HONEYWELL ANALYTICS

Flexible Applications

E3Point integrates easily with your building's analog or digital infrastructure as a standalone unit or network addressable device. Here are five installation examples to make E3Point work for you.

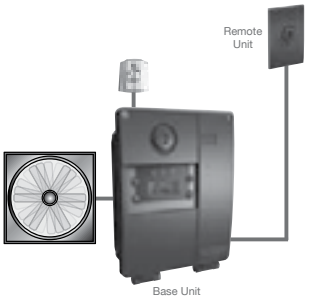

E³Point Standalone Single-Sensor Operation

A low-cost application for buildings with minimal gas monitoring requirements typical of a small facility. Offers easy installation, commissioning and operaton. Two on-board relays can activate fan or strobe.

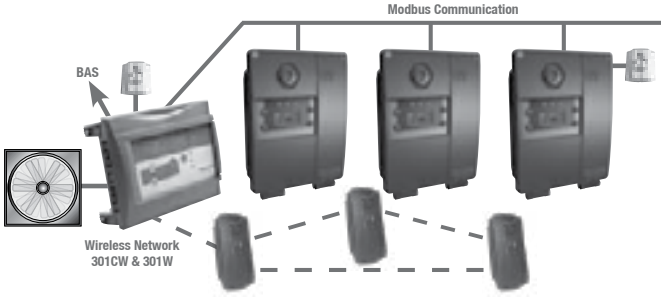

E³Point Standalone Dual-Gas Sensor Operation

Economical application adds option of a second (remote) sensor for dual gas monitoring. Two on-board relays can activate ventilation or strobes.

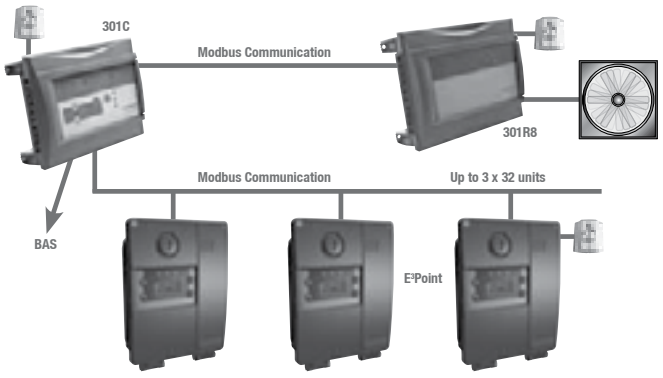

E³Point/Wired-Wireless Hybrid Configuration

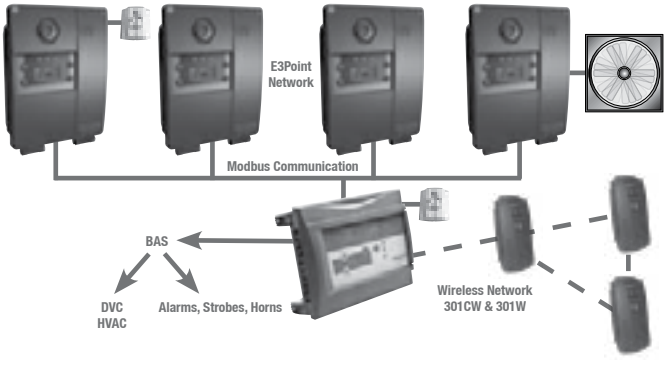

E³Point offers a perfect solution for applications that require a hybrid wireless/wired system. In this configuration, E³Point outputs signals to a controller (301CW) that also accepts signals from a wireless gas detector (301W). This scheme offers great flexibility and installation cost savings for retrofit projects. It easily handles difficult installation challenges, such as those posed by obstructions. A relay output is provided when it is desirable to activate fan/ventilation directly (e.g. when fan is located in close proximity to detector).

E³Point/Modbus Configuration

Supports Modbus protocol to daisy-chain E³Point detectors, providing up to 96 points of monitoring on a serial bus. Excellent option for controller-based (VA301C) installations common in larger applications. A relay output is provided as an option for activating ventilation directly (e.g. when fan is located in close proximity to detector).

E³Point/BACnet (MS-TP) Configuration

E³Point outputs directly to BACnet or other BAS. Alarms, strobes and horns are activated through BAS with link to DCV/HVAC controls. This system design supports new and retrofit installations for large buildings, and can couple with a controller to effectively integrate wired and wireless system components. A relay output is provided as an option for activating ventilation directly (e.g. when fan is located in close proximity to detector).

QUICK SELECTION GUIDE

Tips for Quick Selection Guide

Walk-In Cooler Box Load Parameters

1. 95°F ambient air temperature surrounding box
2. 4" styrene (R=16.7, K=.24) walls/ceiling, 6" concrete slab floor
3. Average product load with 5°F pulldown in 24 hours
4. BTUH load based on 16-18 hour compressor run time for 35°F box (timer recommended) +20 hrs. for 30°F box
5. See Table C for adjustment to box load for glass doors
6. For 80°F ambient temp. surrounding box deduct 12%
7. For 4" Urethane walls + ceiling, 6" concrete slab floor deduct 12%
8. For 10' ceiling height add 10%
9. For additional BTUH load for product cooling see Table A

Walk-In Freezer Box Load Parameters

1. 95°F ambient air temperature surrounding box
2. 4" urethane (R=25, K=.16) walls, ceiling + floor
3. Average product load with 10°F pulldown in 24 hours
4. BTUH load based on 18 hour compressor run time
5. See Table C for adjustment to box load for glass doors
6. For 80°F ambient temp. surrounding box deduct 12%
7. For 20 hour compressor run time (light frost load) in lieu of 18 hour run time, deduct 11%
8. For 10' ceiling height add 10%
9. For additional BTUH load for product cooling see Table D

Table A Product Cooling Loads for Walk-In Coolers

(24 hour pulldown) / 18 hour compressor operation) 24% safety factor added to loads to allow for service

Product	Specific Heat Above Freezing	10 Degree Pulldown BTUH Load for Indicated lbs of Product per 24 hours					
		500	1000	1500	2000	3000	5000
Beef	.72	240	480	720	960	1440	2400

Freezing loads based on product entering at 40°F maximum. For a specific pulldown time, the product load BTU/hr may be adjusted by multiplying the above loads by 24 and dividing by the specified pulldown time in hours. To adjust for 0°F freezer temperature, multiply the above loads by 0.97, and for -20°F freezer, multiply by 1.04

Electrical Units

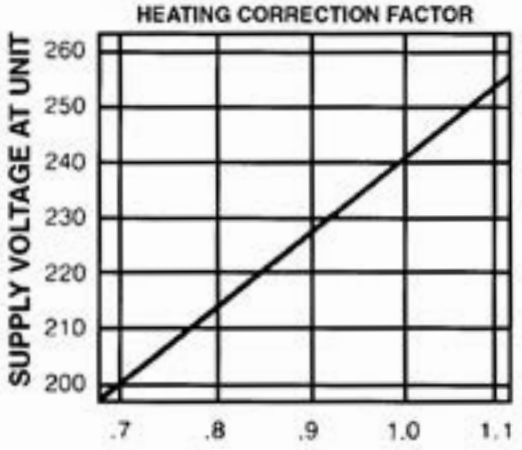

Source: United States Bureau of Standards

The watt is the unit expressing electrical power as horsepower (hp) in mechanics; it is equal to the product of the volts (pressure) times amperes (rate of flow). Thus, 2 volts times 2 amperes would equal 4 watts in a direct current circuit. Electrical energy is sold at so much per watt hour or more generally at a given amount per kilowatt hour - which means 1,000 watt hours. This may represent 1 watt for 1,000 hours or 1,000 watts for one hour. 746 watts are equal to one horsepower or inversely 1 kilowatt (kw) is equal to about 1-1/2 horsepower.

Horsepower represents the power required to lift a weight of 33,000 lbs. 1 foot in 1 minute or 550 lbs. 1 foot in 1 second.

The ohm is the unit of electrical resistance and represents the physical property of a conductor which offers a resistance to the flow of electricity, permitting just 1 ampere to flow at 1 volt of pressure.

Electric Heating Correction Factor

Capacity Correction Factor

For correction of unit output, multiply the correction factor times the KW rating at 240 volts.

$$TR = \frac{3160 \times KW \times VC}{CFM} \quad \text{or} \quad CFM = \frac{3160 \times KW \times VC}{TR}$$

Where:

- *TR* = *temp rise, F°*
- *3160* = *constant*
- *KW* = *KW rating above*
- *CFM* = *air flow at specified conditions*
- *VC* = *heating correction factor*

Formulas – Cooling Capacity *

Total BTUH = CFM x (THC_1 - TCH_2) x 4.5
THC = Total Heat Content or Enthalpy (BTU per lb. of air)

Sensible BTUH = CFM x (T_1 - T_2) x 1.08
T = Dry Bulb Temp (Degrees Fahrenheit)

Latent BTUH = CFM x (W_1 - W_2) x .683
W = Specific Humidity (Grains H_2O per lb. of air (See Psychrometric Chart)

* Based on standard air at 13.3 cubic feet per lb.

Formulas - Heating Capacity*

BTUH = CFM x 1.08 X Rise

$$Cfm = \frac{BTUH\ Output}{108 \times Rise}$$

$$Rise = \frac{BTUH\ Output}{108 \times Cfm}$$

$$CFM = \frac{BTU\ /\ Hr.\ Input}{135 \times \Delta T}$$ Indoor Furnace 80%

$$CFM = \frac{BTU\ /\ Hr.\ Input}{144 \times \Delta T}$$ Outdoor Furnace 75%

$$CFM = \frac{KW \times 3415}{108 \times \Delta T}$$ Electric Heat 92%

* Based on standard air at 13.3 cubic feet per lb.

HOW TO DETERMINE SIZE & SPEED OF PULLEYS OR GEARS & BELT LENGTHS

The driving pulley is called the Driver and the driven pulley the Driven

To determine the diameter of Driver, the diameter of the Driven and its revolutions, and also revolutions of the Driver being given:

$$\frac{\text{Diam. of Driven x revolutions of Driven}}{\text{Revolutions of Driver}} = \text{Diam. of Driver}$$

To determine the diameter of Driven, the revolutions of the Driven and diameter, and revolutions of the Driver being given:

$$\frac{\text{Diam. of Driver x revolutions of Driver}}{\text{Revolutions of Driven}} = \text{Diam. of Driven}$$

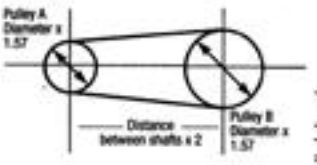

To determine the revolutions of Driver, the diameter and revolutions of the Driven, and diameter of the Driver being given:

$$\frac{\text{Diam. of Driven x revolutions of Driven}}{\text{Diameter of Driver}} = \text{Rev. of Driver}$$

To determine the revolutions of Driven, the diameter and revolutions of the Driver, and diameter of the Driven being given:

$$\frac{\text{Diam. of Driver x revolutions of Driver}}{\text{Diameter of Driven}} = \text{Rev. of Driven}$$

To find OD belt length:

BELT LENGTH FORMULA
Pulley A x 1.57
+ Pulley B x 1.57
+ Distance between shafts x 2
= Belt Length

OD of small pulley + OD of large pulley x 1.57 + twice the distance between shaft centers = OD belt length

---

BLOWER TIPS

- Formula for determining blower speed:

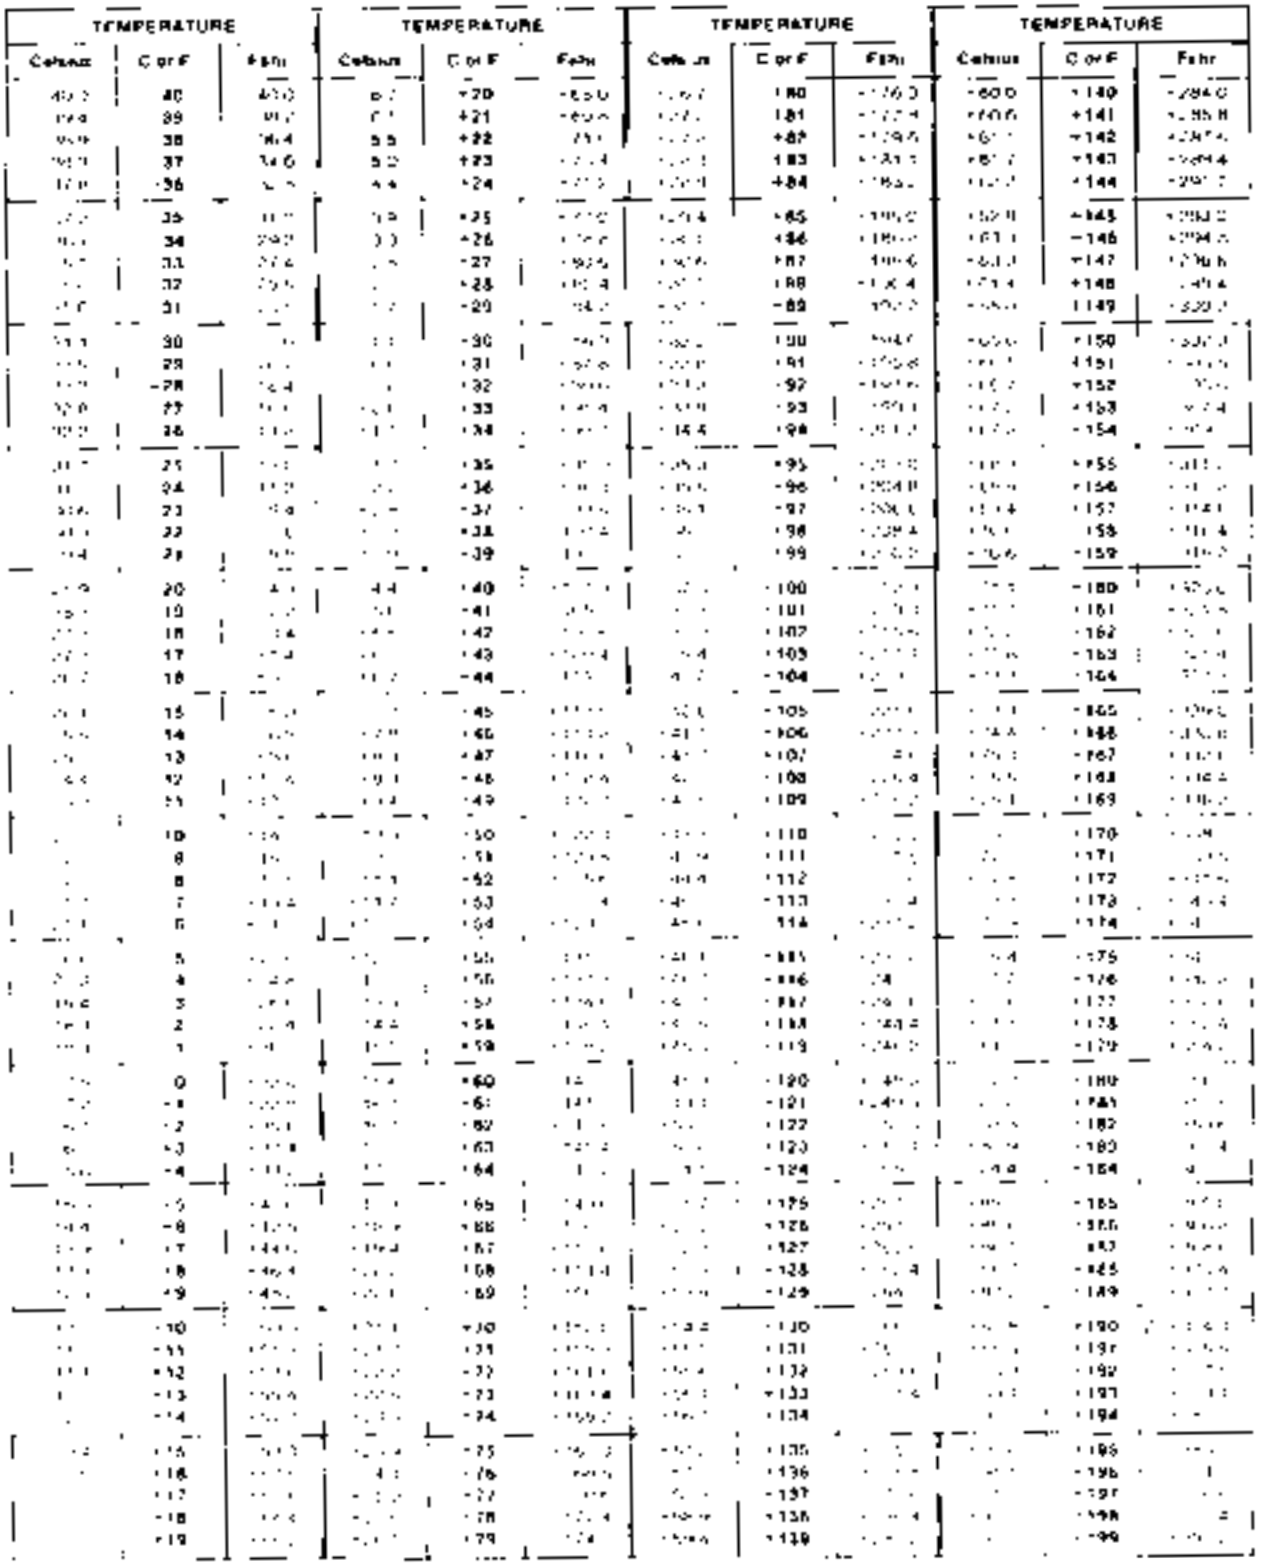

$$\text{Blower RPM} = \frac{\text{Motor Pulley P.D.}}{\text{Blower Pulley P.D.}} \times \text{Motor RPM}$$

- You cannot bench test a blower at free air as it will probably overload motor
- If you double the RPM of a fan or blower you would:
  - Get **twice** the *CFM*
  - Get **four** times the *SP*
  - Require **eight** times the *HP*
- When giving the dimensions of a wheel:
  - **First** dimension should be diameter
  - **Second** dimension stated should be width
- **Specifying Rotation:**
  Double Inlet Wheel = Viewing Hub Side
  Single Inlet Wheel = Viewing Back Plate

CANADA REGULATIONS - REFRIGERANTS

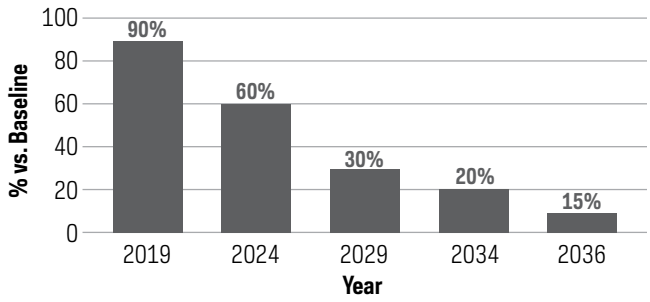

Summary of Environment and Climate Change Canada Regulations Pertaining to Refrigerants

Chemours™

On October 18, 2017, Environment and Climate Change Canada published amendments to the ODSHAR regulations. These amendments will come into force on April 16, 2018. These regulations will adopt a phasedown, but NOT A PHASEOUT, of hydrofluorocarbons (HFCs) in alignment with the United Nations Kigali Amendment to the Montreal Protocol. The regulations also contain product-specific controls by end use that apply to new equipment only.

This regulation does not require the phaseout of HFC manufacturing.

Canada HFC Phasedown

Baseline is determined from the average imports of HFCs plus 15% of HCFCs in 2011, 2012, and 2013.

When Do You Use Bluon TdX 20?

The Only Complete R-22 Replacement Solution

Annual Maintenance
The conversion process also doubles as a comprehensive system tune up, leveraging the maintenance budget set aside by your customers.

System Leak | Refrigerant Loss
If the system has a leak, re-charging with R-22 is expensive and many times against code and Federal Regulations. Upgrade the system with Bluon TdX 20 instead.

Compressor Failure | Re-build
With an already evacuated system due to a compressor failure, converting to Bluon TdX 20 is very cost effective for your customers.

System Repairs Requiring Evacuation
Changing an expansion valve? Cleaning coils? Performing an oil change? With an already evacuated system, converting to Bluon TdX 20 is very cost effective.

Pro-active Energy Efficiency Measure
Converting a system to Bluon TdX 20 creates large savings in energy consumption. Typical energy savings of 10% - 20% and ROI's of 2- 3 years expected.

Pro-active Removal of R-22
Many building owners, asset managers and end-users want R-22 removed from their systems for environmental and operating expense purposes.

Bluon Accreditation Program - Tier II
Tier II prepares contractors to install TdX 20 in systems overs 20 tons. Bluon experts will train mechanical contractors on site for the first three conversions.

*** NOTES:**

1. Sizes that are highlighted indicate maximum suction line sizes that should be used for risers. Riser size should not exceed horizontal size. Properly placed suction traps must also be used for adequate oil return. All sizes shown are for O.D. Type L copper tubing.
2. Suction line sizes selected at pressure drop equivalent to 2˚F. Reduce estimate of system capacity accordingly.
3. Recommended liquid line size may increase with reverse cycle hot gas systems.
4. If system load drops below 40% of design, consideration to installing double suction risers should be made.

*** NOTES:**

1. Sizes that are highlighted indicate maximum suction line sizes that should be used for risers. Riser size should not exceed horizontal size. Properly placed suction traps must also be used for adequate oil return. All sizes shown are for O.D. Type L copper tubing.
2. Suction line sizes selected at pressure drop equivalent to 2˚F. Reduce estimate of system capacity accordingly.
3. Recommended liquid line size may increase with reverse cycle hot gas systems.
4. If system load drops below 40% of design, consideration to installing double suction risers should be made.

*** NOTES:**

1. Sizes that are highlighted indicate maximum suction line sizes that should be used for risers. Riser size should not exceed horizontal size. Properly placed suction traps must also be used for adequate oil return. All sizes shown are for O.D. Type L copper tubing.
2. Suction line sizes selected at pressure drop equivalent to 2˚F. Reduce estimate of system capacity accordingly.
3. Recommended liquid line size may increase with reverse cycle hot gas systems.
4. If system load drops below 40% of design, consideration to installing double suction risers should be made.

Double Risers

A double riser gives the effect of a downsized riser at minimum load, while providing about the same pressure drop as a full sized line at full load. The smaller riser is sized to insure oil return at the minimum capacity step; the larger riser is sized so that the combined "flow areas" of both of these risers are approximately equal to the main suction or discharge line.

Notes:

* Systems that have capacity control between 33 % and 100 % of their rated capacity can maintain a minimum refrigerant velocity of 1500 fpm in vertical risers by using the above refrigerant double riser selection table.
* All tubing sizes stated are nominal outside diameter (OD), type "L" copper.
* Area refers to cross sectional tubing area expressed in square inches.
* Suggested maximum riser height is 20 ft. for refrigeration applications, 25 to 30 ft. increments for air conditioning applications. As the saturated suction temperature goes down, riser lengths also get shorter.

Heat Rejection Factors

Condenser Load = Compressor Capacity x Factor

If heat of rejection figures are not obtainable from the compressor manufacturer, the factors shown in the table below may be used to determine the Total Heat of Rejection (THR).

For systems outside the normal limits of single stage compressor applications, such as compound and cascade refrigeration systems, the following formulae may be used to arrive at the Total Heat of Rejection requirements for the selection of the condenser:

Open Compressors:
Total Heat of Rejection = Compressor Capacity (Btuh) + (2545 x BHP).

Suction cooled Hermetic Compressors:
Total Heat of Rejection = Compressor Capacity (Btuh) + (3413 x kW).

For alternate refrigerant storage capacities in pounds for R-22 rated receivers multiply the rated capacity by the following conversion factors.

Example: A receiver that measures 12 3/4" x 72" has a R-22 rated capacity of 299 lbs.
What is its revised capacity if this receiver is used with R-407C ?
299 lbs x 0.9473 = 283 lbs.

CAPILLARY TUBING

Capillary Tubing - Factors Affecting Refrigerant Flow (Diameter & Length)

The size of the cap tube is fairly critical. Unlike orifices, such as expansion valve seats, capillary tubes depend on their length as well as their diameter to determine their total restriction. The relationship between these two factors are shown in the following charts. A change in diameter on a percentage basis can change the flow more than an equal change in length. To illustrate, changing the diameter by .005" as between .026" I.D. and .031" I.D. can double the flow. Restriction can also be changed by lengthening or shortening the cap tub. The longer the tube, the slower the flow; the shorter the tube, the faster the flow. The general flow curve graph (right) shows what happens to the flow of refrigerant through a cap tube as the length is changed. This curve is not meant to give specific flows but to simply illustrate what happens with all cap tubes so that the general flow pattern can be understood.

By following the flow curve from left to right it can be seen that for the very longest length the flow is the smallest. Then as the cap tube length is decreased, the flow increases slowly until critical point "L" is reached. At this point the flow increases more rapidly with each reduction in length until critical point "S" is reached. From this point on, further decrease in length causes ever increasing flow. From the study of this typical curve, certain pertinent conclusions can be reached that directly affect the field application of capillary tubes.

Typical flow curve showing changes in flow of refrigerant through a capillary tube with a change in the length of the cap tube.

On the graph, the section above the critical point "L" is marked as extra long lengths. Attempting to increase restriction (i.e. reduce flow) by increasing length into this region is not only uneconomical but frequently hopeless. In addition, tubes in this range may not be responsive enough to changes in head pressures during operation. All in all, tube lengths in this range should be avoided where possible.

Continuing down the graph, the section below critical point "S" should be avoided like the plague. In this range, the tube is so short that even small changes in length will cause very large increases in flow. This is caused by the fact that the length no longer affects the flow and the tube now begins to act more like an orifice than a capillary tube. But, without the other components necessary to control an orifice, such as are present in an expansion valve or high side float, a very short cap tube will give wildly erratic operation under varying ambient and loads.

All of this would be meaningless without some definite way to use this information. Although the critical points will vary depending on the I.D. of the cap tubing being used, a very safe operating rule-of-thumb can be offered.

RULE OF THUMB
Keep the cap tube no shorter than 5' and no longer than 16'. As in all general rules there are of course exceptions, but for day to day operation, keeping a cap tub within the 5' to 16' range will eliminate many problems.

An easy way to avoid these problems is to use the R-Line application charts and R-Line capillary tubing. These charts offer recommendations for almost all cap tube systems from 1/20 HP to 5 HP, plus any air conditioner from small window units to large central systems using multiple cap tubes.

To Use Chart

1. Locate recommended cap tube I.D. in left hand column.
2. Read across and find conversion factor under copper cap tube size.
3. Multiply the given length of the recommended cap tube by the conversion factor.
4. The resultant length (Min. 5'/ Max.16') of copper cap tube will give the same flow characteristics as the original recommended cap tube.

Example

Recommended cap tube: 9'–.040 I.D.
Locate .040 in left hand column and reading across gives the following conversion factor: No. TC-36 (.62) and TC-42 (1.25).

Multiplying the recommended cap tube length of 9' by the conversion factor gives the following results: 5½"-TC-36 and 11¼'–TC-42. Either of these two cap tubes will give the same results as the original cap tube of 9'–.040 I.D.

Conversion Chart - Purpose

The "Capillary Tube Length Conversion Chart" was developed to enable users of capillary tubing to use the standard tubing sizes which are available through Refrigeration Jobbers everywhere.

While many original equipment manufacturers and condensing unit manufacturers recommend specific lengths and diameters of capillary tubing for their units, these tube sizes are not always readily available except of special order.

This conversion chart enables the user to translate the recommended length into that of a tube diameter that can be quickly obtained. In using the chart, it is recommended that conversions be made using factors within the unshaded area. In addition, it is highly recommended that the minimum length of capillary used be 5 feet.

R-134a – It is suggested to add 10% to length.

Recommended capillary tube lengths for each circuit in an air conditioner evaporator where R-22 is the refrigerant. All recommendations must be considered approximate and variations may arise in actual field applications.

Window air conditioners normally have 1 circuit and the recommended cap tube can be read directly from the chart. Larger units have 2 or more circuits in the evaporator. Where this is the case, simply divide the total BTU rating of the unit by the number of cap tube circuits to obtain the BTU/CIRCUIT rating of each individual cap tube.

Example:
Air conditioner is rated at 27,000 BTU and has 3 cap tubes connected to the evaporator. Divide 27,000 by 3 = 9,000 BTU/Circuit. From the chart, this would call for .075 I.D. (TC-75) 72 inch long.The length and I.D. of any cap tube may be adjusted to a more readily available size by using the conversion chart.
